Historic Documentation
Bridge J1000, Daniel Boone Bridge
St. Louis & St. Charles Counties, Route 40/61
MoDOT Job Number J6P1436

Location: Across the Missouri River, Highway 40/61, St. Louis and St. Charles Counties

Construction Dates: 1936-1937

Present Owner: Missouri Department of Transportation, Jefferson City, Missouri

Present Use: Highway Bridge carrying U. S. Highways 40/61 (Interstate 64) westbound, to be removed

Significance: The Daniel Boone Bridge (J1000) is a steel, four-span, rigid-connected, continuous through truss with a Warren web, and four steel Warren deck truss approach spans. It is 2,614-feet long with a roadway width of 32-feet. It was designed by the Missouri State Highway Department and built by the Kansas City Bridge Company. It has Moderne details on the concrete spill through piers. The bridge played an integral role in the expansion of the St. Louis metropolitan area by facilitating transportation across the Missouri River. The bridge is significant in the areas of engineering and transportation.[1]

Historian: Karen L. Daniels, Historic Preservation Section, Design, Missouri Department of Transportation, Jefferson City, Missouri, September 2013

Introduction

The Daniel Boone Bridge (J1000) is located on U. S. Highway 40/61 over the Missouri River between St. Louis County and St. Charles County. The bridge is a steel, four-span, rigid-connected continuous through truss with a Warren web and four Warren deck truss approach spans. It measures 2,614 feet long and has a roadway width of 32 feet.[2]

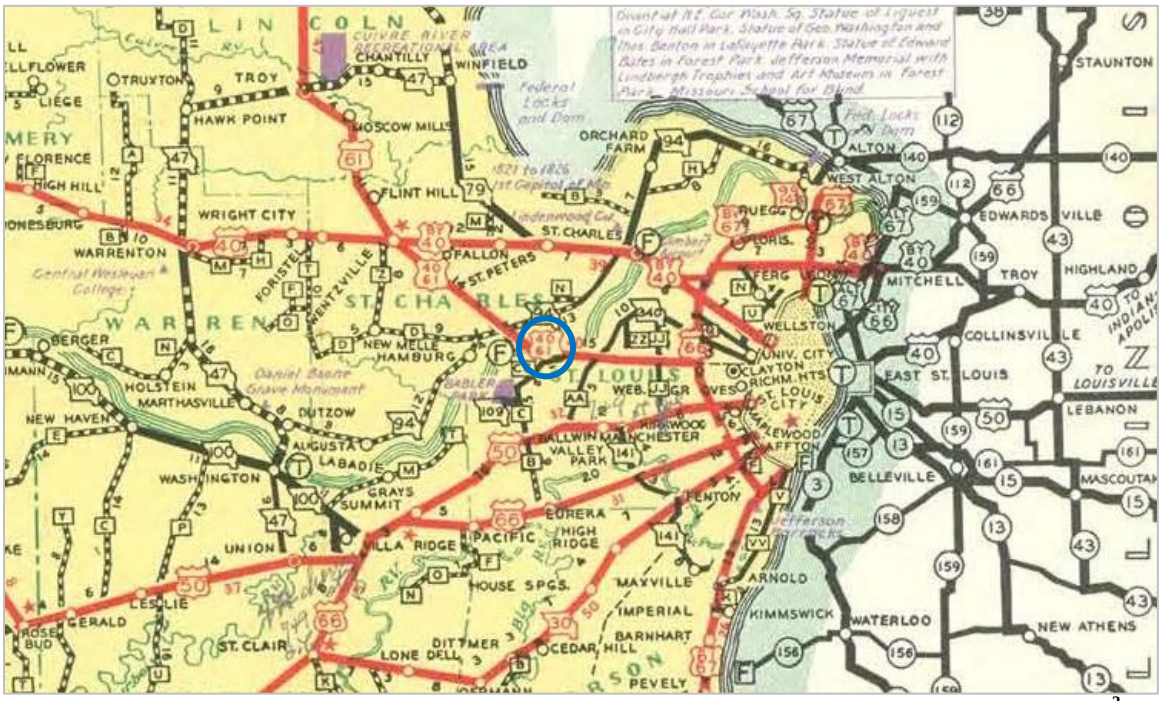

Figure 1: The location of the Daniel Boone Bridge, US 40/61, St. Louis & St. Charles Counties.[3]

The historic 1936-37 spans, J1000, carry westbound traffic and a companion bridge (A4017), constructed in the 1980s carries eastbound traffic. As part of job J6P1436 the Missouri Department of Transportation plans to construct a new bridge upstream of the existing bridges, this bridge would carry eastbound traffic and westbound traffic would be transferred to A4017. Recent bridge inspections have indicated that the Daniel Boone Bridge has suffered extreme deterioration and it is not feasible to rehabilitate. It will be removed as part of the project. This will have an adverse effect on the character defining features of the bridge.[4] This documentation is prepared as partial mitigation of these adverse effects.

Historic Overview

Introduction

Planning for a bridge at Weldon Spring[5] began in the late 1920s but construction was delayed by channel improvements to the Missouri River, arguments over funding for roads in Missouri, lawsuits over the location of the connective highway improvements in St. Louis County and St. Charles concerns about losing prestige with possible rerouting of highway 40 onto the new highway. Each of these obstacles presented challenges to the construction of the bridge at Weldon Spring. The bridge also became a rallying point for opponents of Proposition 3, a proposal to increase highway funding by issuing $75 million in bonds. Only as each of these issues was addressed was construction of the bridge able to move forward.

Early Bridge Planning 1927-1932

By 1927 traffic congestion on U. S. Highway 40 between St. Charles and St. Louis had gotten very bad. The bridge over the Missouri River at St. Charles was a toll bridge and the western approach road had sharp curves and the highway through St. Louis County was a two lane highway with a streetcar line running down the middle of it. In September the State Highway Department outlined three options for reducing traffic congestion:

1. Early construction of the St. Louis belt line between Pattonville and Mehlville on the Lemay Ferry Road, which would connect all the radial state highways and would divert some traffic off of Highway 40. This would cost about $900,000 of which $500,000 was currently available.
2. Construction of a branch Highway 40 beginning at Wentzville, which would cross the Missouri River on a new bridge, near Chesterfield, and go into St. Louis on the Olive Street Road.
3. Widen Highway 40 between St. Charles and St. Louis from the present width of 18-feet to 36-feet, which would permit four lanes of traffic instead of the existing two lanes.[6]

State Highway Department Chief Engineer T. H. Cutler said widening the existing road would be possible within the existing right of way, but questions would be raised about placing that ahead of other primary roads on the state system. The branch road would depend on the State Highway Department being given the authority to add more miles to the primary road system.[7] Since the toll bridge at St. Charles was a bottleneck on Highway 40 the State Highway Department would monitor traffic conditions in the area and would work with the community to find solutions to the

[5] The community name is "Weldon Spring" although it was, and is, frequently referred to as "Weldon Springs". In this document the proper community name will be used except when referred to in a quote or title, in which case it will be used as it was in the original material.

[6] "Highway Department Plans Taking Traffic Around St. Charles." *St. Charles Banner-News*, 8 September 1927, p. 5; "Wellston and St. Charles in Same Boat." *St. Charles Cosmos-Monitor*, 14 September 1927, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

[7] "Highway Department Plans Taking Traffic Around St. Charles." *St. Charles Banner-News*, 8 September 1927, p. 5. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

problem. On Sundays and holidays there were usually long delays at the bridge caused by the small force of toll collectors.[8]

In November 1927 Theodore Gary, former member of the State Highway Commission, began advocating for two more bridges across the Missouri River—one at Washington and another six miles south of St. Charles with a new highway built from Gilmore connecting with the Olive Street Road in St. Louis County.[9]

On December 21, 1927 the St. Louis County Court issued a permit to build a bridge at the end of the Olive Street Road to E. M. Elliott and Associates, a bridge building company from Chicago.[10] St. Charles County concerns pointed out that this bridge, in connection with the new branch highway being discussed by the State Highway Department, would "relieve traffic congestion out of St. Louis, but only at a tremendous expense to the taxpayers of this state." They recommended instead that the Natural Bridge Road be extended and improved, saying it "would do as much for St. Louis as the 2 or 3 million dollar extension to Wentzville."[11]

In January 1928 Representative Niedringhaus introduced a bill seeking Congressional approval to build a bridge over the Missouri River on Olive Street Road. The *St. Louis Globe-Democrat* reported the bridge would be constructed by E. M. Elliott and Associates. The "purpose of the bridge would be to relieve the traffic congestion on the St. Charles Rock road, which is a federal highway. It would, therefore, be necessary for St. Charles to construct a road branching off the State Highway No. 40 to connect with the new bridge." The new bridge would be a toll bridge until the cost of construction was recouped and would then be turned over to the state.[12]

In January 1928 the Olive Street Bridge promoters appeared before the St. Charles County Court for authority to build and operate in the county. The E. M. Elliot and Associates was described as having about $50 million available in foreign bonds which it had decided to withdraw from and invest in American improvements. The County Court was told the bridge would not be built unless the traffic existed to justify the expenditure of the funds and the State Highway Department guaranteed to build the branch highway to connect the bridge to highway 40 at Wentzville. If those two requirements were met, the bridge would be constructed immediately. When bonds were sold to pay for the bridge, 10% would be allowed for promotion, 7.5% would

pay interest on the debt, and the balance would pay for bridge maintenance and retiring the bonds. A trustee would be appointed to receive all monies collected.[13]

The St. Charles County Court decided to postpone granting authority for the bridge company. They reasoned that since the project was dependant on the State Highway Department agreeing to construct the branch highway, and it being unclear that the State Highway Department would ever build the road, granting the authority would be premature. The County would lose the opportunity to work with a company that was less dependent on State Highway Department activities.[14]

In early March newspapers were reporting that there were questions about the E. M. Elliott and Associates firm, and members of the Missouri delegation to the U. S. Congress were opposed to granting them any additional franchises for bridges. The *St. Charles Banner-News* reported that according to Congressman John J. Cochran, opposition was centered on Elliott's "schemes for 33 bridge projects."[15] Engineers for the J. G. White Company of New York were reporting negatively on the proposed Olive Street Road and three other Missouri projects proposed by the Elliot Company: the Carondalet Bridge, a Missouri River Bridge near Kansas City, and a Missouri River Bridge near Arrow Rock, they had no intention of financing the construction of the bridge or acquiring the franchise for the bridge.[16]

On March 27, 1928 the St. Louis County Chamber of Commerce sponsored a mass meeting at Schneider's Hall in Gumbo to discuss the building of a bridge across the Missouri River near Gumbo and the proposed widening of the Olive Street Road. The meeting was called as efforts to block the granting of a franchise to build the bridge to E. M. Elliott and Associated were being made by Congressman Cochran.[17] The Chamber of Commerce position was that it favored building as many bridges as possible across the Missouri and Mississippi Rivers. If the county and state could not build free bridges then "a toll bridge is better than no bridge at all."[18]

Over 200 people attended the meeting in Gumbo. They were told by presiding County Judge Albert Wehmeyer that E. M. Elliott & Associates "had been well recommended and that until an attack had been made on the firm there appeared no question but that the bridge would be

[18] *ibid*.

constructed."[19] Wehmeyer continued by indicating that the only charge lodged against the firm was that they were attempting to secure bridge franchised throughout the country. M. C. Kessler, a representative of the Elliott firm, said his company would assist the citizens of the county in securing a franchise, even if it was not to the Elliott firm, "as the bridge was really needed."[20] A committee was formed to find a St. Louis citizen willing to take the franchise, if that would make giving it more palatable to the Congress. The committee included Dr. Denny, Mr. Ruth (president of the St. Louis County Chamber of Commerce), Mr. Stevens, Mr. Hartnett and Mr. Wilmas.[21]

In April 1928 the U. S. House of Representatives debated the Missouri River bridge franchise. They questioned "the propriety of passing bills authorizing the construction of bridges over navigable streams by Eugene M. Elliott."[22] Evidence was introduced that Elliott had pleaded guilty to tax law violations in 1925 and had been fined $500.[23]

On May 9, 1928 Chief Engineer Cutler announced that a toll free bridge would be constructed across the Missouri River at Olive Street Road, by the State Highway Department, unless some other interest starts definite plans and provided the $75 million bond issue (Proposition 3) passed. The State Highway Commission proposed to build a "broad new outlet from St. Louis to Wentzville, by way of Olive Street Road, to relieve congestion around St. Charles if the bonds are voted."[24]

On May 29, 1928 the U. S. Congress granted J. H. Haley and his heirs, legal representatives and assigns, the rights to build a bridge across the Missouri River at or near a point about 3,500 feet downstream from mile 45, approximately 5,000 feet downstream from where Olive Street Road would intersect with the Missouri River, if projected out.[25]

On July 25, 1928 the Olive Street Road Bridge Company was formed. The company was created with 500 shares of capital stock, each valued at $100. The Board of Directors consisted of ten shareholders. The original board consisted of W. G. Simrall, Susan Simrall, Ralph W. Nolen and J. H. Haley of Clayton, Paul Ring and E. E. Stith of St. Louis, A. G. Schumacher of Kirkwood,

William Stoecker of Webster Groves, and G. M. McLain and J. F. McLain of Valley Park. J. H. Haley was the President of the Company. Each of the original board members was subscribed for fifty shares of stock. The purpose of the company was to construct and maintain a bridge over any body of water in Missouri, including approaches and to charge tolls for vehicles, pedestrians and livestock crossing the bridge.[26]

That same day, the St. Charles County Court adopted a resolution granting Haley a franchise to build the bridge opposite the Olive Street Road near Weldon Spring. The bridge was described as a toll bridge to be constructed on a 100-foot right of way along and across the Missouri River. The County Court was assured that work on the bridge would begin within one year and that the bridge would be completed within two years. Tolls were not to exceed 75 cents for a car and driver, $1.25 for a bus and driver, $1.00 for a half-ton truck and driver, and 5 cents for each additional passenger or animal.[27] The State Highway Department would build a concrete road from Wentzville at the intersection of Highways 40 and 61 to the new bridge. The road depended on the November bond issue, and would require several years for plans, right of way acquisition and construction.[28]

Haley contracted with Sverdrup & Parcel for the engineering of a new bridge and the Kansas City Bridge Company for soundings to identify the best location for the bridge.[29] By August Sverdrup & Parcel had developed preliminary plans for a bridge with two continuous spans over the main Missouri River channel with 400 feet clearance between piers and six simple approach spans on the St. Louis County side and a deck truss approach span on the St. Charles County side (see Figure 2 below for a profile of the Sverdrup design).[30]

In November of that year Haley approached the State Highway Commission about assuming the contract for designing the proposed bridge, since the passage of Proposition 3 meant more funds for state highways.[31] Haley proposed giving the Commission the franchise to build the bridge in

return for assurances that it would be constructed as a free bridge. Funding from Proposition 3 would be available in late 1929, since legislation enabling the sale of bonds needed to be passed by the Missouri Legislature in early 1929, and the bonds would need to be issued and sold.[32]

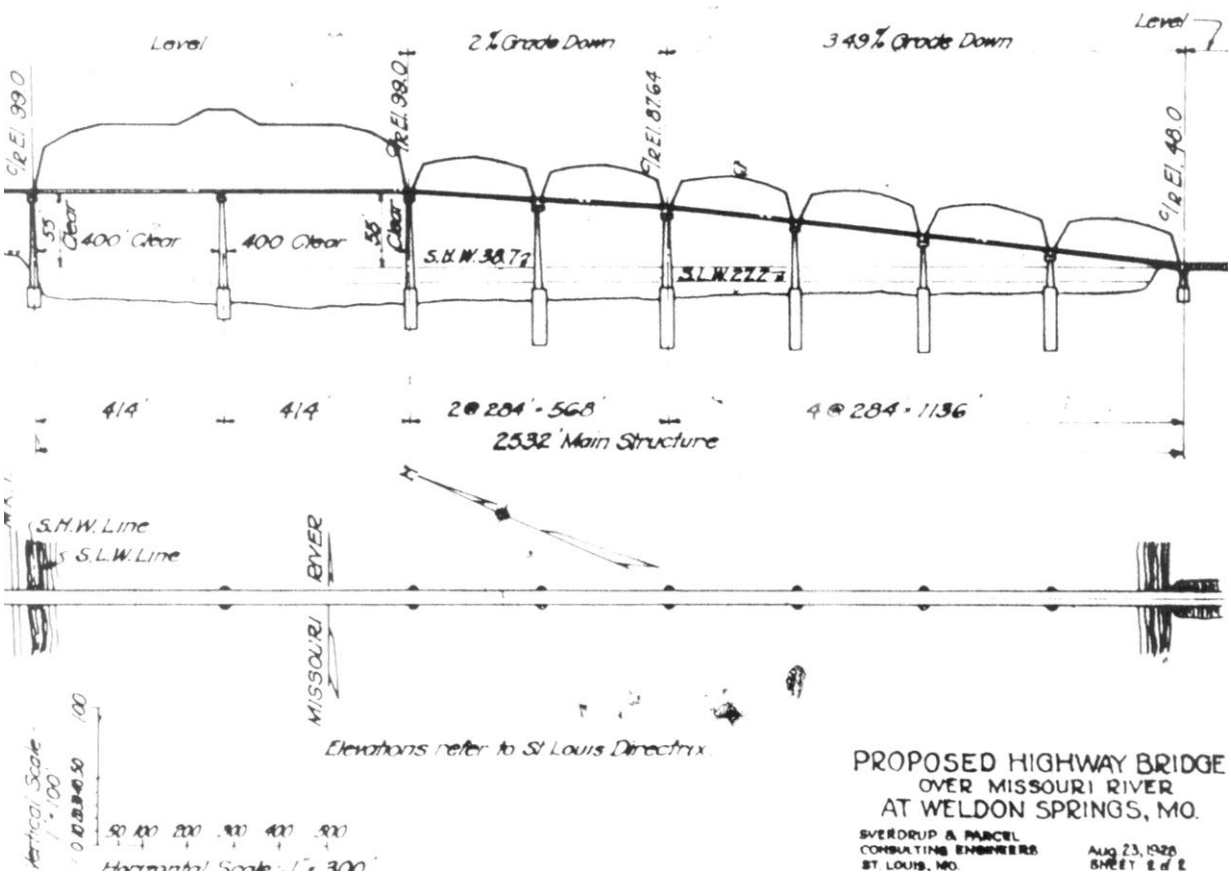

Figure 2: Sverdrup & Associates Proposed Bridge Profile

Although the Commission did not immediately accept Haley's proposal, by April 1929 they had, and were in negotiations with him for appropriate compensation for the franchise. The parties eventually settled on $3,500 compensation.[33] In June 1929 the Olive Street Road Bridge Company officially dissolved.[34]

Sverdrup & Parcel offered to make preliminary studies for the location of the bridge and to design the bridge for the State Highway Department. In March 1929, Chief Engineer Cutler presented the State Highway Commission with a letter from Sverdrup offering his services for a

commission of 2.5%. The Commission instructed the Chief Engineer to give the matter consideration and to report later concerning the matter.[35]

The State Highway Department proceeded with planning to the bridge and associated roadways. In April 1929 the Commission authorized the Chief Engineer to execute whatever instruments were necessary to get War Department approval to build a bridge over the Missouri River.[36] The application was forwarded to the War Department in early May[37] and was approved by the Secretary of War before the end of the month.[38] The highway department intended to take bids on the project during the first part of October 1929[39] and had received interest in bidding from many companies including the Independent Bridge Company, the Wisconsin Bridge Company, the General Contracting Corporation, the Missouri Valley Bridge & Iron Works, the Kansas City Bridge Company and the Stupp Brothers Bridge Company.[40]

In May 1929 the State Highway Commission indicated it intended to let the contract for the Weldon Spring Bridge in August and that the bridge should be ready for use in August 1931.[41]

On May 14th the Army Corp of Engineers scheduled a public hearing in Jefferson City on the application by the State Highway Commission to build a bridge across the Missouri River. The bridge was described as three channel spans with the left, center and right spans being level and three approach spans on the right (south) would have a down grade of 3.3%. It would have a clearance of 55 feet above standard high water.[42]

Few spoke in support or opposition to the bridge at the public hearing held by the Corp of Engineers. As the project sponsor, T. H. Cutler, Chief Engineer of the State Highway

Department, was asked to make a statement on the bridge. Cutler's statement indicated that the proposed bridge was being considered as a response to "rapidly increasing traffic congestion on U. S. 40 and U. S. 61, west of St. Louis." A study by the State Highway Department, in cooperation with the St. Louis County Court, the County Engineer, and the County Plan Commission showed that the "best plan for relieving this traffic congestion would be by means of an additional road from Wentzville, in St. Charles County, to St. Louis, making necessary a new bridge over the Missouri River at some point near Weldon Springs."[43]

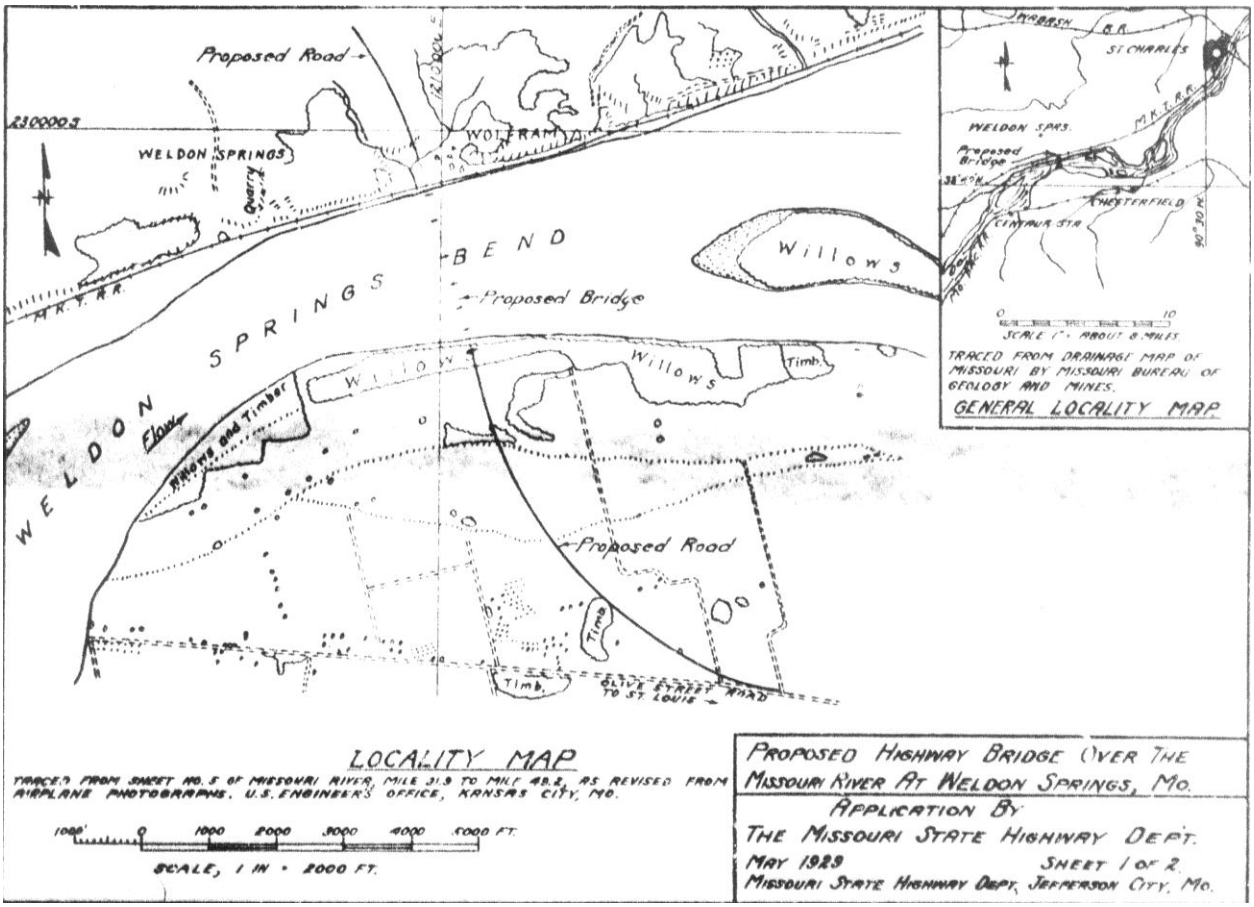

Figure 3: Proposed bridge location in 1929

Bridge Engineer N. R. Sack described the preparatory work that had been done for the bridge. Sack said that bridge plans were approximately one-third completed, three soundings had been made, and three days of clearing had been done at the bridge approach sites.[44]

One comment was received against the proposed bridge, from the Pilot of the Snagboat Horatio G. Wright, Gerald Friemonth. He opposed building a bridge across any navigable stream, and

[43] "Report on Public Hearing Held in the State Highway Building on May 15, 1929, at 10 o'clock, on the Application of the State Highway Commission to the United States War Department for Permission to Construct a Bridge over the Missouri River, Near Weldon Springs, Missouri, 43.7 miles above the mouth." Construction file, Bridge J1000. Bridge Division, Missouri Department of Transportation, Jefferson City, Missouri.

[44] *ibid.*

thought that the channel changes along this stretch of the Missouri River made building a bridge across it particularly challenging to navigation. He recommended that the proposed channel work be completed across the river before any bridge be approved.[45]

The St. Charles Free Bridge Committee also provided comments. Sam Hodgdon, Chairman of the Committee, wrote on its behalf, indicating that it had "no desire to in any way interfere with the building of a bridge at the end of Olive Street. On the contrary we would like to cooperate with you in the effort to solve the traffic congestion through St. Louis County." He went on to say that people in St. Charles and Wellston had been assured, during the campaign for the Proposition 3 bond issue, that if a bridge was constructed at Olive Street before the St. Charles Bridge was made free; the State Highway Commission would pay off the balance due on the bridge. He wanted reassurance that would happen for the community in exchange for support for the bridge.[46]

John Mather, Assistant Attorney for the State Highway Department, closed by saying:

> "The construction of this bridge will make it possible for us to carry out the promises made to the people of St. Louis and St. Louis County during the campaign last fall for the constitutional amendment authorizing a new $75,000,000 bond issue for the completion of the state highway system in Missouri. In that a part of this bond issue is to be used in the relief of traffic congestion in St. Louis and St. Louis County by the construction of additional roads and the widening of existing highways. In order to adequately relieve this traffic situation, it is necessary to have some means of crossing the Missouri River beside the present bridge at St. Charles. The construction of this bridge will meet a long felt need and provide traffic with an easier access to the City of St. Louis. This situation is very urgent and is one of the reasons urged so that the early construction of this bridge may be begun."[47]

In May the *Cosmos-Monitor* was reporting that local farmers were unlikely to donate right of way for the new superhighway between Weldon Spring and Wentzville. William Boehle of Dardenne was quoted as saying landowners were not inclined to donate.[48] The State Highway Commission policy was to require local communities to acquire, through purchase or donation, the right of way for state highways, and then give the land to the State for the highway. Property owners who could not come to an agreement with the local purchase committee were purchased through condemnation of their property by the State Highway Department.[49]

[48] "Farmers Want Pay for the Right-of-Way." *St. Charles Cosmos-Monitor*, 15 May 1929, p. 7. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

[49] Missouri State Highway Commission. Seventh Biennial Report of the State Highway Commission of Missouri for the Period Ending December 1, 1930. Jefferson City, MO: Botz Printing Co., 1930.

By early July the plans for the bridge had been approved by the War Department. The estimated cost of the bridge was $1.25 million and it was estimated that the bridge would be completed about 18 months after construction began. The State Highway Department was still planning to let contracts in August 1929.[50]

Bridge planning had caused a "considerable land boom" in the Weldon Spring area. Land prices in the area had "been boosted about twice its normal value" since the bridge planning started.[51] Weldon Spring was "alive with expectation. The boom is already on which will make it a town of probably 1000 people."[52]

In July the *Post-Dispatch* printed a picture of what the new bridge would look like. It was indicated that the new road would leave highways 40/61 at Wentzville and would cross the Missouri River at a free bridge at a point near the Olive Street Road, and enter St. Louis on a route to be decided later.[53]

The U. S. Army Corp of Engineers informed the State Highway Department that there was a "grave possibility" that the Missouri River might change its course at the site of the proposed bridge at Weldon Spring. Chief Engineer Cutler recommended to the State Highway Commission that further work toward the letting of the contract be suspended until an investigation into the report had been made and recommendations as to location could be made. The Commission approved the action, and active work on the bridge letting stopped.[54]

By late October 1929 the State Highway Department was informing companies that they were planning on waiting until the following spring to receive bids for the project to determine if the river was likely to alter channels again.[55]

In December 1929 the State Highway Department announced that funding for the Weldon Spring Bridge and the relief highway would not be included in the 1930 highway construction program because the route for the highway had not been selected. The letting of the bridge was also

deferred until a route was selected. Further action on the route had been held up pending completion of a survey of the proposed route.[56]

Despite not being included in the 1930 construction program, the bridge design continued. In February 1930 the design for the Weldon Spring Bridge was approved. It was a 3,454 foot steel truss bridge with a concrete substructure with an estimated cost of $1,250,000.[57]

Toward the end of 1931 surveys were being made for the superhighway location and of the Missouri River, to obtain the most economical location. The new location for the bridge was about one-half mile upstream from the original location and was near the Weldon Spring quarry. The new location had been submitted to the Corp of Engineers, but had not yet been approved. The location was between 200 and 300 feet narrower than the previous one, and would save between $80,000 and $120,000 in construction costs. The bridge would still cost about $1,000,000 to construct.[58]

Division Engineer Sam Rudder tried to dispel rumors that the State Highway Commission was considering abandoning the Weldon Spring project in March of 1932. He said that the rumors were untrue, that there was "no question" the bridge would be built, and that he expected construction to begin within the next year. Construction had been delayed because of an injunction against the superhighway location in St. Louis County, but with Congressional authority to build the bridge expiring on March 3, 1933, the State Highway Department wanted to begin construction before that time.[59]

Proposition 3 and the Weldon Spring Bridge

By the mid-1920s it was apparent that with the existing funding sources for construction the Centennial Road System would not be completed to meet the demands of Missouri motorists. In 1927 the Automobile Club of Missouri proposed a $120 million bond issue for road construction. The State Highway Commission felt that sum was too much, and proposed instead a $60 million bond program. In early 1928 Governor Sam A. Baker was asked to help the parties reach an agreement that could be brought before the voters. He appointed a Special Compromise Committee with one representative from the Automobile Club of Missouri, one from the State Highway Commission and four members of his own choosing. The Committee met several times, and reached agreement that a $75 million bond proposal would meet the existing road construction needs.[60]

The bond issue was placed on the 1928 general election ballot by initiative petition, and was known as Proposition 3. The proposition called for a $75 million bond issue with the money to be used:

- To expedite the completion of the 7,640-mile Centennial Road Law System,

[60] State of Missouri. *Official Manual for Years Nineteen Twenty-nine and Nineteen Thirty*. Jefferson City, Mo: Botz-Hugh Stephens Press, 1929, p. 741.

- To reimburse counties and other civil subdivisions for roads taken into the state system,
- To add 300 miles to the Centennial Road Law System,
- To relieve traffic congestion in St. Louis and Kansas City by constructing about 200 miles of traffic relief routes,
- To construct 7,000 miles of supplementary state highways and bridges in each county of the state, and
- To make connections to state parks.[61]

In October 1928 the *St. Charles Banner-News* was predicting that the bond issue would not receive strong support in the county. Residents concern about rerouting highway 40 "certainly arouses a strong antipathy" toward the issue.[62] The paper did go on to recommend support for the issue since the State Highway Commission was determined to build a new bridge near Weldon Springs and a highway to connect it to highway 40 near Wentzville. The paper argued that building a free bridge at St. Charles would alleviate the need for the alternate route and predicted that Proposition 3 would fail because it "is not enthusiastically supported" in many parts of the state.[63]

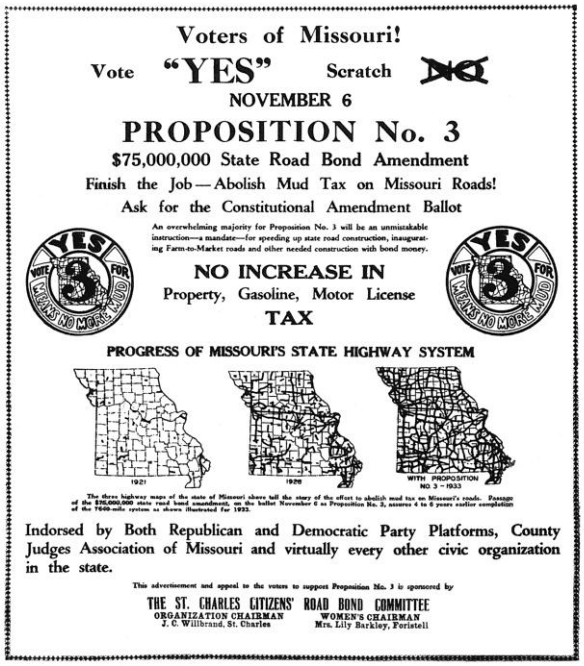

Figure 5: Pro Proposition 3 Ad from *Wentzville Union*[64]

The *Cosmos-Monitor* described voters as being in a "quandary as to their duty in voting for or against the proposed $75,000,000 bond issue for roads in Missouri. It is the duty of voters to vote

[61] *ibid*, pp. 741-743.

[64] *Wentzville Union*, 2 November 1928, p. 8. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

for the best interests of the state, the county, the city and themselves. That's what our people are thinking about. For the best interest of the State we believe we had better vote for the bond issue, for the better interests of the county, perhaps we had better vote for the bonds, but how about the best interests of the City of St. Charles, the best interests of the citizens of St. Charles? That's the perplexing question which confronts the St. Charles voter."[65]

The *Cosmos-Monitor* postulated that if St. Charles had some guarantee that highway 40 would not be routed away from the City, leaving it off the map, it would be easier to support the bond issue. However Sam Rudder, Division Engineer for the State Highway Department, was quoted by the *Globe-Democrat* [sic, it was actually in the *Post-Dispatch*] as saying highway 40 would be routed over the new highway and St. Charles would not be on the federal highway system. If that is correct, "St. Charles is going to vote solidly against the bond issue."[66]

In late October 1928 voters in St. Charles County were told by the St. Louis Chamber of Commerce that the proposed bridge was not dependant on the bond issue, that the company was ready to start work on the structure.[67]

The St. Charles Citizens Road Bond Committee supported the proposition, and placed advertisements in local newspapers, including *The Wentzville Union*, urging support saying a "vote for 3 means no more mud."[68]

In St. Louis County it was noted that if Proposition 3 passed with the $75 million in bond sales, nine additional highways would be built in the county with state funds.[69]

Proposition 3 passed with the necessary two-thirds majority needed to become law. It passed in St. Louis County but did not pass in St. Charles County. S. M. Rudder, Division Engineer for the St. Louis Division of the State Highway Department sent a letter to J. C. Willbrand, chairman of the St. Charles County Good Road Boosters, in which he expressed his regret that "St. Charles County is the only county in Division 6 which voted down Proposition No. 3. … I am sure that the people of St. Charles County who voted yes will not have any regrets for helping to pass this measure and I hope a great majority of those voting no will realize the seriousness of their error

in the not distant future."[70] The Editor of the *Cosmos-Monitor* wrote, "The only way it can be accounted for that our people voted adverse to the bond issue is that they were under a misapprehension. It is hoped that the actions of our voters will not cause the Highway Commission to retaliate, and not build the roads they had anticipated in this county."[71]

An analysis of township voting patterns in St. Charles County by the *Banner-News* revealed that the proposition was not supported in the townships that would be most directly benefited by it—those in the path of the new bridge and the new pavement that would join with highway 40 at Wentzville.[72]

In mid-November 1928, after Proposition 3 passed, John Haley and Senator Ralph met with the State Highway Commission and offered the franchise for the bridge at Olive Street Road, as long as it would be operated as a free bridge and that it would be constructed as soon as possible.[73] The State Highway Department indicated that money from the bond issue should be available in late 1929. Before it would be available the Missouri General Assembly needed to pass legislation enabling the bond sales, and then the bonds had to be issued and sold.[74]

In 1929 some state legislators in the House of Representatives attempted to change Proposition 3. The St. Charles Representative, Louis Ringe, was among "the insurgents."[75]

Missouri River Channel Improvement Delays 1929-1933

In March 1929 a dredge boat arrived from Memphis to begin work on a $2.5 million program to deepen and clear the Missouri River channel between St. Louis and Kansas City to improve navigation and facilitate shipping.[76]

In 1930 there was additional work done in the Missouri River in the vicinity of Weldon Spring when 9000 feet of dikes were constructed.[77]

In 1931 Congressional approval to construct a bridge was sought. This new authorization required that the bridge be started within two years and completed within five years.[78] Work did not commence on the bridge at that time due to an injunction filed against the State Highway Department. The Department was advised not to do any work on the bridge until the suit had been disposed of.[79]

The new federal public works programs made it possible to proceed with the Weldon Spring bridge in 1933. Although plans had been prepared in 1929, the channel changes made by the Corp of Engineers had changed the conditions and it necessitated relocating the bridge.[80] The project was resubmitted to the U. S. Army Corp of Engineers (War Department) for approval in September 1933.[81] The application was approved, with the proviso that a new congressional approval would be obtained, since the 1931 act had expired.[82]

In 1934 Congressional authority to construct the bridge was extended two years, from a starting date of March 3, 1933.[83]

Fighting in St. Charles County about the Bridge & U. S. Highway 40 1927-1937

In mid-1927 a traffic study was conducted to determine where vehicles crossing the Mississippi River at St. Louis than travelled. The study revealed that Route 66 was increasing in patronage 60-70% and that the popularity of the National Old Trails Road (Highway 40) was decreasing by about 85%. Since it was estimated that the average tourist spent between $8 and $10 in each town they stopped in, this was a major cause for concern for communities on highway 40.[84]

[84] "Traffic Leaving Highway No. 40—Why?" *St. Charles Cosmos-Monitor*, 17 July 1927, p. 3. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

By September 1927 communities along highway 40 recognized that something had to be done to relieve congestion along the highway between St. Louis and St. Charles but were determined to fight the road being detoured around them, causing them to be taken "off the map."[85] The communities considered being removed from the highway as a death sentence.

As early as December 1927, residents of the City of St. Charles recognized the possibility that placing a free bridge over the Missouri River at Weldon Spring could mean moving highway 40 away from the City. They viewed the bridge as a rival, fearing the "that the [passage] of the big bond issue would mean a misfortune to this city, because of the strong movement to place a bridge across the Missouri River, south of town, which would connect up with a road joining the State Highway near Wentzville. Such a road would detour traffic away from St. Charles. It was feared this bond issue would furnish the money for the rival bridge."[86]

Even the toll bridge that received Congressional approval in 1927 worried St. Charles, because they feared highway 40 would be moved away from the city. The toll bridge was not the only traffic issue in the city, there was also the highway route through the city and parking along the highway. The State Highway Commission had been working with the City to improve traffic flow but "St. Charles refused to cooperate with the Commission." After local protest about the parking ban near the bridge the ordinance was repealed and instead of employing the twelve toll collectors that were necessary to keep traffic moving the city employed only six, causing traffic backups that could last "an hour or two".[87]

Chief Engineer Cutler wrote that the proposed cutoff highway from Wentzville to the Olive Street Road was "one of the new outlets to handle congested traffic in St. Louis, which the Commission believes should be built to properly handle traffic in the vicinity of that population center."[88]

The Editor of the *Cosmos-Monitor* wrote that the only way St. Charles could fight the proposal would be to put up a fight in the legislature when the proposed new road law is put before the body. "St. Charles must wake up now and put up a good strong fight to hold the airline road [highway 40] between St. Louis and Kansas City."[89]

In January 1928, just after E. M. Elliott and Associates came to the St. Charles County Court for approval to build the bridge, the St. Charles Chamber of Commerce appointed a committee to go

[89] *ibid*.

to the State Highway Commission to oppose the new bridge and the diversion of highway 40 away from St. Charles. The committee was composed of H. H. Wilmes, Paul Houser, R. M. Thomson, Harry Osiek, Elmer Bruns, Charles Cappel, George Dierker, John Walkup, Edward Pundman, Joe Machens, Dr. W. S. O'Neal, Charles B. Mudd, Charles E. Richtern, Fred B. Meyer, Guy Motley, Herbert Sandfort, Henry Broeker, Judge August Weinrich, Judge William Nolle, Judge Fred Keisting, and Edwin Werner.[90]

When Elliott's financing fell through, the *Cosmos-Monitor* crowed, "This means there will be no bridge built in competition with the St. Charles Highway Bridge for some years to come at least."[91]

In October 1928 Sam Rudder, the St. Louis District Engineer of the State Highway Department, was quoted in the *St. Louis Post-Dispatch* as saying that highway 40 would be pulled away from St. Charles when the new highway and bridge were completed and St. Charles would be left off the federal highway system.[92] Rudder denied making the statement, and the reported admitted that he added his own thoughts about relocating the highway to the article, and they ended up attributed to Rudder.[93]

In May 1929 the St. Charles Junior Chamber of Commerce met to set up a committee to meet with Sam Rudder, the district engineer for the St. Louis district, and the State Highway Commission about the effort to make sure highway 40 was not rerouted away from the City of St. Charles.[94]

Rudder spoke at a luncheon in St. Charles later in the month, and told the citizens of the St. Charles that the new road would inevitably divert a large percentage of traffic away from St. Charles, but he saw no immediate reason to change the designation of highway 40. He said that the construction of the Chain of Rocks bridge and the Lewis and Clark bridges, then under construction, would make up for the diverted traffic. He also said the city must fix the city streets that lead to the bridge, including redirecting traffic and enforcing no parking zones near the bridge to improve the traffic conditions around the bridge.[95]

[94] "Effort to Retain Highway 40 Made by Junior C. of C." *St. Charles Banner-News*, 2 May 1929, p. 2. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

[95] "St. Charles Must Begin Now to Solve Traffic Situation, Rudder Says." *St. Charles Banner-News*, 9 May 1929, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

An editorial in the *St. Charles Banner-News* on May 16 responded to Rudder's speech by saying that St. Charles must depend "upon her natural strategic position as a traffic center and in no way upon the inclination of the State Highway Department." It went on to say that it was apparent the Weldon Spring Bridge would be among the first project financed by the new bond money and could be carrying traffic before the St. Charles bridge could be freed from tolls. Rudder's speech gave no reassurance for the retention of the highway 40 designation, and "the best that can be hoped for consistently is that both the route across the Weldon Spring Bridge and that across the St. Charles Bridge will be designated as 40."[96]

Congressman Clarence Cannon sent a letter to the Junior Chamber of Commerce in St. Charles voicing his support for their efforts to keep highway 40 routed through the community. He wrote that he was glad to note the aggressive stand the group was taking on the diversion, and that in his opinion highway 40 was correctly routed through the city. He told the group that it was his understanding that the State Highway Commission had agreed to continue to designate highway 40 along the present route.[97]

In December 1930 the *St. Charles Banner-News* reported that Chief Engineer T. H. Cutler had announced that the State Highway Department was planning to award the contract for the substructure of the new bridge the next fall (in 1931). The article went on to say that the announcement indicates Cutler takes it for granted the new route will be designated as highway 40, completely ignoring the present highway thru St. Charles.[98]

In June 1931 St. Charles was again hopeful of receiving improvements, including the new bridge, rather than them occurring elsewhere in the county. The *St. Charles Banner-News* reported on the difficulties selecting a superhighway route in St. Louis County, and reported that Chief Engineer Cutler had said that if a route could not be selected highway 40 through St. Charles might have to be improved, including a new bridge. The paper speculated that if that occurred, and a new bridge was constructed in St. Charles, than there would be no need for construction of the Weldon Spring bridge and that project would be dropped.[99]

A "Keep the Highway" organization was formed by St. Charles businessmen and all interested parties from Wentzville to the Page Avenue district in St. Louis in 1932. The movement was sponsored by the St. Charles Junior Chamber of Commerce with the aid of "prominent parties" in St. Louis County. Although they were resigned to the superhighway being built, they were

determined to fight having the highway 40 designation being removed from the current alignment. They stated, "U. S. Highway 40 has always been the main source of travelers coming into this city and with the route changed it would keep thousands of people out of here each year. Unless action is taken, St. Charles will just be another city off the highway."[100] Judge Sam D. Hodgdon of Clayton was named Chairman of the committee to "Keep the Highway"; Brick Travis was named Secretary, and Charles Cappel, Treasurer. Two members from each service club in St. Charles and St. Louis counties formed the rest of the committee. Hodgdon stated that "Business men are taking steps to keep the highway here, where it rightfully belongs."[101]

In February 1932 the *St. Charles Banner-News* again speculated that the Weldon Spring Bridge project might be dropped when the State Highway Commission acquired the right of way formerly owned by the St. Charles streetcar line down the center of highway 40 and across the recently freed St. Charles Bridge. This would enable the State Highway Department to build a 40-foot wide highway between Lindberg Boulevard and the St. Charles Bridge. The paper said that if St. Charles could improve street conditions through the city the State Highway Department "will probably abandon the Weldon Spring bridge."[102]

New attacks were made against the new superhighway and bridge in early 1933. An editorial in the *St. Charles Cosmos-Monitor*, titled "Millions for Superhighway—Farmer in Mud" blasted the money being spent on the superhighway for the perceived benefit of St. Louis pleasure drivers, saying there was "no earthly need of the new road." The editorial called for

> "…a change to take place in the Highway Department at Jefferson City. Governor Park is going to make changes in the Commission and it is hoped the new Commission will see the light and spend the money for necessary roads before piling up for pleasure seekers and letting Missouri people drive in the mud without making any effort to build roads for the farmers and small town people. Every county in Missouri needs farms to market roads and not a cent should be spent for unnecessary roads until "Missouri Gets Out of the Mud," which was the slogan when the big bond issues were put over. Missouri is not out of the mud and never will be unless money is taken care of instead of being used for such a road as is now being proposed."[103]

The article included statements that St. Charles had lost many amenities recently, including the streetcar line across the bridge and the Wabash passenger depot. Now it would be removed from highway 40 "without one word of protest against the imposition to be imposed upon us."[104]

[104] *ibid.*

In January 1933, after the injunctions against the superhighway had been dismissed, residents of St. Charles increased their opposition to the highway and the bridge. A group of businessmen again organized to fight the construction of the highway, arguing that the road would cost $5 million and the bridge $3 million and "would merely afford St. Louis motorists with a Sunday pleasure ground." The group further argued that highway 40 and the St. Charles Bridge could be widened at a much lower cost.[105] J. Ed. Travis was elected Chairman of the committee, Dr. B. H. Neabeiser was elected Secretary, and Charles Cappel was appointed treasurer of the group and was expected to be soliciting subscriptions from area businesses to support the fight against the new superhighway.[106] As the St. Charles group organized a group of farmers from the western part of the county also organized to support the highway and "offset any influence brought by groups fighting the new highway."[107]

On February 19th a mass meeting was held at the St. Charles County Courthouse for the purposes of showing support for keeping the highway 40 alignment along its existing route. Representatives from St. Peters and O'Fallon were also present at the well attended meeting. The finance committee to fight the new highway raised $100 for the effort.[108]

The St. Charles branch of the Daughters of the American Revolution (DAR) also joined the controversy by endorsing the movement to retain and improve existing highway 40. They supported the effort because St. Charles was a historically significant community and tourists using the new alignment would miss historic spots if the highway was deflected toward Weldon Spring and they thought it was a bad idea to build a new bridge when one already existed. They encouraged other DAR chapters to use their influence to keep the highway routed through St. Charles.[109]

On March 11 the farmers supporting the new highway and bridge held a mass meeting in Howell. Speakers included Senator Williams of Matson, L. A. Orf of Dardenne and Matthew Schenbendrien of the Howell area. Farmers from New Melle, Weldon Spring, Hamburg, Augusta, Matson, Dardenne and Howell attended. They passed a resolution petitioning the State

Highway Commission to proceed with the construction of the new highway and bridge as soon as possible.[110]

William Hirth, President of the Missouri Farmer's Association, also opposed the Wentzville cut-off, contending "there is little, if any, traffic congestion on highway 40, except on Sunday evening, and this does not justify spending $3 million to build the 40-mile cut-off."[111] Since Governor Guy Park opposed cutting the cost of automobile tags since it would delay the building of farm to market roads, Hirth responded, "Somebody should tell the Governor that the Highway Commission is getting ready to spend $3,000,000 on a 'luxury road' for the pleasure seekers of St. Louis, joy riders, instead of spending the money on farm to market roads." Hirth further said the State Highway Department should "devote practically all its available funds to an improvement to farm to market roads, rather than adding to our cross-state system at this time."[112]

In May 1933 a delegation from St. Charles, lead by Dr. Ben Neuheiser, J. Ed. Travis and C. J. Harris went to the State Highway Commission and filed a protest against spending money on the superhighway and bridge. The delegation supported improving the existing Route 40, and said that the traffic relief route was "unnecessary, as there is little congestion on the route except for certain hours on holidays."[113] A rival delegation from St. Charles, Lincoln and Warren Counties, led by T. E. Pitman of Wentzville, and Mr. Russell, Secretary of the Hannibal Chamber of Commerce, appeared in support of the traffic relief route and "urged that US 40TR, between Wentzville and St. Louis, be built as soon as possible."[114]

In July the State Highway Commission announced work on the superhighway would be started soon, and that it would be designated 40-TR, "which, otherwise expressed, is 40 for traffic and will be so labeled" the existing highway 40 would continue to be known as that, but would have

no initials associated with it.[115] With federal aid the road would be constructed from Wentzville to a point near Denny Road.[116]

Wentzville saw opportunity in the new superhighway; the highway and bridge across the Missouri River gave the city "a wonderful chance to increase its population and induce large business enterprises to locate here."[117] To take advantage of that opportunity, a new Community Club was formed in an effort to stimulate business and work for the general welfare of the community.[118]

Wentzville's activities were noticed by neighboring communities in the county, inflaming the rivalry caused by the possible prominence the community would gain with the new road and the possible relocation of highway 40. The editor of the St. Charles Banner-News:

> would call attention of our [St. Charles City] local business men and residents to the present activities of Wentzville, our neighboring city. There is every indication that means a fight to stay on the map. It's the only way of surviving. Wentzville has exceptional possibilities brought about by the new bridge and highway to be built in the near future by way of Weldon Springs from St. Louis County. It's laying the foundation to make the best of its opportunity and unless St. Charles wakes up and does its part for itself, Wentzville will step into the lead.[119]

St. Charles had not given up on preventing the Weldon Spring Bridge even by the end of 1933 with the philosophy that until it had been built, it was possible to steal the money away and build the bridge in St. Charles instead. In December 1933, the *St. Charles Cosmos-Monitor* speculated that if "St. Charles, with a united front, laying aside all selfish likes and dislikes can bring the matter [of building a new bridge in St. Charles] before the Highway Commission and show that body where the proposed traffic relief can be secured and at the same time save at least $3 million of the peoples money" the Highway Commission would improve existing highway 40 from Wentzville to St. Charles, skirt St. Charles, cross the Missouri River on a new bridge built just below the city, and rejoin the existing highway where there was already sufficient right of

way to widen the highway. They continued "St. Charles would retain its present bridge, and secure the new bridge both within the city limits."[120]

Suggestions on marking the new highway and the existing highway continued to come to the State Highway Commission. In August 1934, the Assistant Chief Engineer, Sam Rudder, presented the Commission with a letter from Charles W. Meyer of Moscow Mills requesting that the traffic relief route between Wentzville and St. Louis be marked U. S. Highway 61 and the existing highway be designated U. S. Highway 40. The Commission "expressed approval of the change being made after the construction of the traffic relief route and agreed that in order to avoid confusion in the records, action should be delayed until after the construction of the traffic relief route."[121]

As construction of the superhighway and bridge were underway, there were calls in St. Charles for improvements to highway 40. Service clubs "declared war" on local leaders for not pushing the State Highway Department to widen the bridge and assure the city "at least a goodly portion of traffic after the auxiliary highway is completed." Each service club appointed committees to spur the City Council and the State Highway Department to action on improvement to the existing route.[122]

In May 1936 local attorney William Waye, Junior, in a Letter to the Editor, said the State Highway Department would be more likely to keep highway 40 routed through St. Charles if the County took over the Lewis and Clark bridges between St. Charles and Alton, and developed a plan to free them from tolls within twenty years. If not, he said it was likely that highway 40 would be rerouted since the State Highway Department had not signed an agreement to keep it in St. Charles.[123]

The City and County Club of St. Charles worked to send a delegation of 500 citizens to Jefferson City in June to visit the State Highway Department and present petitions for various improvements and widening the highway 40 bridge approach at St. Charles.[124]

In 1937, as the Weldon Spring Bridge neared completion, plans were made to close the St. Charles Bridge for two to four months for extensive repairs. This upset the community because

"while the bridge is closed here three or four months, motorists and truckers will be educated to use the Weldon Spring route. Then it will be hard to coax them to again use the old route."[125]

St. Louis County Residents Fight Superhighway Plans 1929-1937

A delegation from St. Louis County appeared before the State Highway Commission in April 1929 to protest the use of Conway Road as a state highway. Jefferson Smith, President of the St. Louis Chamber of Commerce let the delegation. He protested the use of Conway Road as part of the traffic relief highway saying it "passes through one of the best residential sections of St. Louis County, that right of way would be very expensive to obtain, and that the designation of a state highway through such a residential section would destroy much of its value." He recommended the routing the highway over Clayton or Hibler Roads instead. The Commission instructed the Chief Engineer to investigate the matter, to determine is some other location could be worked out and to report his findings at a later date.[126]

The following month, a delegation from Wellston, led by Stanley Sidmon, appeared before the Commission to protest against the traffic relief route. He represented citizens of Wellston and the surrounding area who believed that instead of providing traffic relief through the construction of the cut off, better results could be obtained by widening the existing road.[127]

In May 1929 the St. Louis County Court sent a written invitation to the State Highway Commission and Chief Engineer T. H. Cutler, asking them to meet with the Court and go "over the ground" before selecting a route for the superhighway to be established as the new U. S. Highway 40.[128] Residents along Conway Road were also to participate in the discussion. Conway Road residents were suggesting the use of Hibler Road as an alternative location to the route.[129] The State Highway Commission gladly accepted the invitation, and set May 29 as a convenient day for the meeting.[130]

The State Highway Department announced that it would hold a public hearing in St. Louis County about the location of highway 40. The new route would begin in Wentzville and come

into St. Louis County over the proposed free bridge near Olive Street Road. The route from there to the St. Louis City limit was under consideration:

- Conway and Clayton Road--residents on Conway were opposed to this route because it would "destroy what is being built into an exclusive residential district"
- Hibler Road--which was opposed for the same reason
- Olive Street Road was supported by some
- Delmar Boulevard was considered an option by other.[131]

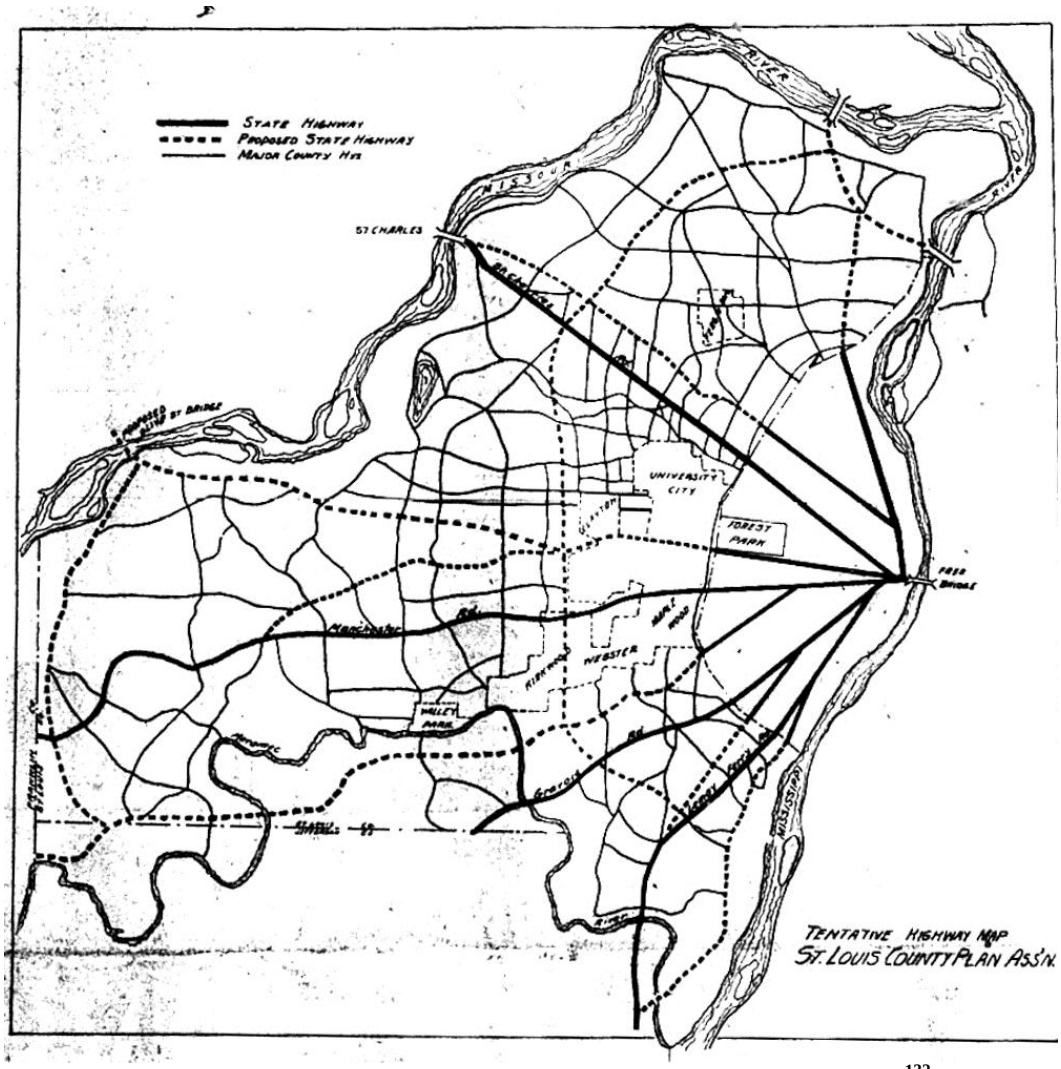

Figure 6: Map Showing Proposed State and County Highways, 1928[132]

Chief Engineer T. H. Cutler said that from an engineering perspective he believed the Conway route would be best with the Hibler route a second choice. He further stated, "I believe everyone

is agreed on the fact that there should be a road somewhere in that vicinity, but the general feeling is that it should be some place other than past their property."[133]

County Court Judge James S. Gardner was quoted as assailing the motives of those opposed to routing the proposed new state highway, from Wentzville in St. Charles County, to St. Louis, over the Conway and Clayton Roads. He said it was "purely from selfish motives that they [the wealthy people with country homes on county highways] are interfering with plans to reduce congestion of traffic into St. Louis from St. Charles County."[134]

In May 1929 efforts were made to promote the Olive Street Road option. An Olive Street Road Association formed to promote the use of the alignment for the highway.[135] In addition, Eugene Ruth, the Mayor of University City offered the State Highway Commission four miles of 100-foot wide concrete paved roadway as an inducement to select the Olive Street Road for the superhighway.[136]

On May 29 the public hearing was held, and about 175 people attended. Residents of Conway Road attended to protest the consideration of that route, declaring the highway would spoil their homes. Petitions were presented both supporting and opposing the Olive Street Road option. Using Page Avenue was also mentioned as an option with some landowner support.[137]

In August 1929 it was reported that the selection of a route had been delayed because property owners wanted too much money for right of way. It was also reported that three alternates were being considered: one just south of and parallel to Clayton Road, through the Hibler Road, and through Clayton and Ladue Roads. The St. Louis Chamber of Commerce was trying to iron out difficulties so the State Highway Department could proceed with planning and selection of a route.[138]

In October 1929 supporters of Page Avenue formed the St. Louis County Highway League to support using Page Avenue as the superhighway route. League president, William Beban,

appointed a committee charged with acquiring the necessary right of way for the option, which would then be donated to the State Highway Commission without cost.[139]

The Clayton *Watchman Advocate* published an editorial encouraging property owners not to object to the superhighway. The editorial noted that sixty residents of the Conway-Clayton route do not object to the superhighway. Other residents, "many of whom own large homes, more valuable because of their distance from heavily traveled roads, have objected" to the location stating it would reduce property values according to the editorial.[140]

In November 1929 St. Louis County hired Harland Bartholomew and E. O. Mills (working as Bartholomew and Associates) to undertake a highway planning study to determine where improvements needed to be made and what the scale of those improvements needed to entail.[141]

In March 1930 the Page Avenue alternative was eliminated from consideration for the superhighway route by the State Highway Commission. Although the Page alternative had been endorsed by the St. Louis County Chamber of Commerce, the North St. Louis Business Men's Association and the County Highway League, the State Highway Commission decided that instead of routing the new superhighway along the highway, it would instead carry part of Highway 61. The Clayton and Conway/Hibler Road alternates were opposed by property owners who had built in the area "to avoid heavily traveled roads."[142]

As 1930 continued it was speculated that the superhighway would not tie into highway 40/61 at Wentzville, as previously stated, but could tie into highway 40 west of the city, to better relieve congestion. It was stated that it could tie in as far west as Wright City, and that highway 40 would be assigned to the new route and Highway 61 assigned to the present highway through St. Charles.[143]

In June 1930 seventy residents along the Conway-Clayton route presented a petition to the State Highway Commission protesting the proposed highway location. Their reasons for protesting the location were:

> "That such route would greatly impair the present value of this property and render the same almost useless for the purposes for which most of it was purchased.

> "That a number of sites upon which residences and other buildings of great value are constructed were selected in order to be remote from highways and thus to insure privacy and quiet.
>
> "That the various parcels of land at present serve to protect each other, and improvements of great value have been erected on many of them in reliance upon the continuance of said protection.
>
> "That the proposed route will divide various tracts in such a manner that valuable acreage will be cut off from residence and be rendered totally useless for the purposes for which said acreage is now used.
>
> "That there will be no benefits whatever accruing to the property through which this superhighway will pass as there will be no access to it from any of the land through which it will pass, because of the proposed fences or barriers to be erected on each side of it.
>
> "That these tracts are of peculiar value to the respective owners and the destruction of them could not be adequately compensated for by a money award on condemnation.
>
> "That in the opinion of the undersigned this tract surrounded as it is by large estates and beautiful homes, within such a short distance of St. Louis, is the most desirable tract in St. Louis County, and should be preserved as it is, no only in the interest of the owners, but in the interest of real estate values in this entire section of St. Louis County.
>
> "The undersigned further state that in their opinion, the proposed super-highway could be more economically constructed along the Olive Street road where they understand the abutting property owners are very anxious to have it located."[144]

In August 1930 the Bartholomew and Associates report was released.[145] The report, entitled *A Preliminary Report on a System of Major Highways for St. Louis County, Missouri*, identified Route 40 as soon to be constructed by the State Highway Department. The route was described as including a new bridge constructed over the Missouri River west of Chesterfield, and running across Missouri Bottom land to Olive Street Road to Chesterfield. From there it ran to just west of the intersection of the Clayton Road and the North and South Road (Lindbergh Boulevard) on a new right of way to be acquired.[146]

[145] "Plans for County Roads Submitted." *Watchman Advocate*, 15 August 1930, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

[146] Bartholomew, p. 42.

The Clayton Road route as one of six dominant radial routes the Bartholomew report recommended to be developed; it was to include a 150 foot cross section to accommodate rapid transportation facilities. The road was to be relocated to about half way between Clayton Road and Conway Road. West of the North and South Road the new alignment was described as "only a few large estates, fronting on these two streets [Clayton Road and Conway Road] between Gay Avenue and Ballas Road. The new location is through unsubdivided and unimproved land and should be acquired immediately with a minimum width of 150 feet, which should be increased to 200 feet where unusual topographic conditions are met."[147] The report said the alignment should be "unobjectionable" to the large property owners on the new alignment.[148]

The area was further described as "improved with buildings with an ample set-back so that the right of way necessary to provide for an eight-lane thoroughfare may be acquired at this time without interfering with any existing expensive improvements."[149]

It was reported that "numerous alternative locations have been studied but none have been found with equal advantages."[150]

Chief Engineer T. H. Cutler reported that there were no conflicts between residents of St. Louis County and the State Highway Department over the route of the superhighway. The superhighway would be routed south of the Clayton Road from the intersection of the North & South Road and Clayton Road, it would run south of the the Log Cabin Country Club, cross Clayton Road and Warson Road and continue west between Conway and Clayton Roads until it ran into Conway Road at Bellefontaine, where it would join the Olive Street Road. Cutler said no time had been set for the construction of the superhighway as right of way still needed to be acquired.[151] Work would also not progress on the new bridge because the Corp of Engineer had not been able to locate the channel of the Missouri River, so the State Highway Department had not been able to definitely locate where to place the bridge.[152]

In December 1930 the *Watchman Advocate* informed citizens that the State Highway Commission would be spending $2 million on highways in the St. Louis area in 1931. One project not in the plan for 1931 was the highway 40, "because of the controversy over the route

of the road from the new bridge over the Missouri River to the St. Louis limits." A hearing on the route had been scheduled for January.[153]

At least 200 people attended the January 14, 1931 special meeting of the State Highway Commission. Attorney Walter R. Mayne led the group opposed to the Clayton-Conway option. He represented about 70 property owners from the Fair Oaks, Ladue, Price and McKnight Roads areas. Baxter Brown and W. C. Bernard had a printed booklet outlining their arguments opposing the option. Opponents described the area as "the most beautiful residential and estate district of St. Louis County."[154]

Supporters of other alternates also spoke at the hearing. Downtown merchants spoke in favor of both the Olive Street and Page Avenue options, since they would be able to bring traffic into downtown via Franklin; the St. Louis Real Estate Club was also in favor of either of these options. Mayor Eugene Ruth of University City offered to give the State Highway Commission a 100-foot wide paved Olive Street if the highway was routed on that street. The University City Kiwanis Club spoke in favor of the Olive Street option.[155]

Harland Bartholomew defined a superhighway as a rapid transit road at least 200-feet wide. He stated his belief that the Clayton-Conway route was the only practical route. He said that there are only three true estates along the route; the other acreage will probably develop like subdivisions. He further said that a basic plan was needed and "while there must be some recognition of local conditions entire route cannot be shifted at will merely because some individual or group does not wish it in that particular location." As to the extra cost of the route, Bartholomew said, "what if the Clayton route does cost $50,000 to $100,000 more, you are getting a superhighway, not an ordinary street."[156]

Another meeting on the superhighway was held on January 20. The plan selected by the State Highway Commission was not the plan preferred by St. Louis County. Property owners objected because they did not want a superhighway near their homes while those with property to sell wanted the highway routed near their land. It was anticipated that many condemnation suits would be necessary for the State Highway Department to get the necessary right of way for the highway.[157]

In February 1931 the County Plan Association held a meeting to take a position on the routing of the proposed superhighway. About 200 people attended the meeting, including representatives of

[157] "State Having Hard Time To Get Right of Way." *St. Charles Cosmos-Monitor*, 21 January 1931, p. 8. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

nearly all 20 of the communities in the Plan Association. At the meeting Walter Mayne suggested a new alternate for the superhighway that would route the highway across a relatively undeveloped area of the county and adjacent to the Terminal Railroad Association tracks. The Association, on a split vote, decided to oppose the Clayton route for the superhighway, but did not support an alternate route. At the meeting Harland Bartholomew reiterated his support for the Clayton route as the only logical solution to future traffic problems.[158]

Also in February the County Highway League voted to protest the Conway-Clayton route and support the Page Avenue Route.[159]

In March the St. Louis County Highway Engineer, the County Court and Walter Mayne presented the State Highway Commission with the new alternate that had been discussed by the County Plan Association. The alternate would use Clayton Road between the city limits and the North and South road, then parallel the Terminal railroad to a point where the tracks, McKnight and Delmar would meet (if extended), then go due west 11-½ miles to Chesterfield to meet Olive Street Road and the bridge proposed by the state. The State Highway Commission agreed to consider this option.[160]

In late March the *Watchman Advocate* printed an editorial on the business of locating state roads. In a dig at the *St. Louis Post Dispatch*, the editor reminded readers that the business of locating state roads rests with the State Highway Engineer and his staff, not to property owners or newspapers. It continued, "Fortunately, the State Highway Department is not obliged to give consideration to political or personal influence brought to bear."[161]

In June the State Highway Commission announced that the new superhighway would be located on the Clayton-Conway alternate. Opponents immediately promised to fight the decision, saying they would go to the Supreme Court with their argument, if necessary. The controversy had already delayed the construction of the highway for two years, and construction could not begin until the next year, since funds for the year had already been allocated. The State Highway Commission "had not decided what action it will take on the erection of a bridge" that had also been delayed by the controversy.[162]

[162] "Court Fight is Planned on New Superhighway." *Watchman Advocate*, 12 June 1931, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

The *Watchman Advocate* congratulated the commission for having "courage of conviction" in the location of the new superhighway. It further urged opponents to stop "quarrelling with the State Highway Commission, and threatening to delay construction of an important thoroughfare by resorting to litigation, it would be infinitely better to sit around a council table and consider without prejudice all factors which enter into the location, construction and maintenance of a super-highway and the probable volume of traffic it will carry."[163]

In a letter to the Editor, signed "Wayfarer" opponents of the super-highway were asked to acquiesce to the Commission decision since the "the building of this much needed road and the bridge at Weldon Spring to carry it over the Missouri River has been already delayed two years by the tactics of the objectors."[164]

An injunction was filed in US District Court on September 7, 1931 to prevent the St. Louis County portion of the superhighway from being constructed. Property owners contended that the highway would spoil their residential district.[165]

In March 1932 it was reported by the *Watchman Advocate* that the injunction, filed in the federal court, against the superhighway should be heard during the March term of the Federal Court in Jefferson City. The injunction had been filed by Griffin Watkins, a shoe salesman and resident of Illinois who owned property along Clayton Road, and 71 other property owners. By the time of the news report the project had already been delayed for more than one year.[166] Motions to strike portions of the State Highway Commission answer to the restraining suit were heard in March. Hearings on the merits of the suit were delayed until the October session of the court, due to the court schedule.[167]

In July 1932 a Letter to the Editor, signed "Iconoclast" appeared in the *Watchman Advocate*. The writer accused property owners of delaying the project for three years, and went on to say he "hoped Judge [A. J.] Reeves will decide [the] matter decisively at an early date so work on the highway can be started."[168]

[168] "Conway Road Hearing." *Watchman Advocate*, 15 July 1932, p. 10. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

In the July 22 edition of the *Watchman Advocate* published a Letter to the Editor following the court granting a sixth continuance to Watkins. R. R. DeArmond called on citizens to voice their support for the superhighway and the bridge. He also called the County Court, civic and welfare organizations hypocrites because in their ongoing "War on Depression" they had remained silent about the superhighway and bridge project while pleading for funds to feed the unemployed.[169]

In late September 1932 it was announced that the Federal Court hearing on the Watkins injunction would be heard on October 31. The suit had been filed in September 1931 on behalf of 72 property owners concerned that their property values would be diminished by construction of the highway. Judge A. L. Reeves would hear the case and expected it to last several days.[170]

In early October 1932 another Letter to the Editor on the superhighway appeared in the *Watchman Advocate*. Signed "Conway", the writer hoped that the court would "tolerate no further delay" in the building of the road and stated that three million dollars would do much to relieve unemployment.[171]

The Chief Engineer informed the State Highway Commission, in November 1932, that the citizens of St. Louis opposed to proposed location of traffic relief 40 had dismissed their injunction suit against the project in federal court and had filed a similar suit in circuit court in Cole County. "Action was taken to delay the surveying of the proposed highway and hold off work on this route. [Cutler] further stated that the new suit does not prohibit the department from making surveys" and requested the Commission advise him of the proper policy to pursue regarding surveys for the highway. The Commission instructed Cutler to proceed with surveys and plans.[172]

In November 1932, in another Letter to the Editor, a writer signed "Ladue" accused the "coterie" of St. Louis County residents who were delaying the project of attempting to defeat the will of the people and prevent money from being spent providing work for the unemployed. The author said taxpayers should demand that those filing lawsuits against the project should be forced to post a large bond for losses caused by construction delays. By the time this letter was published Watkins had withdrawn his suit and a new lawsuit had been filed against the State Highway Commission.[173]

[173] "More Delay in Building the Super Highway." *Watchman Advocate*, 11 November 1932, p. 10. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

At the January 10, 1933 meeting of the State Highway Commission, the Chief Engineer informed the Commission that the lawsuit filed by St. Louis County property owners to restrain the traffic relief 40 project had been dismissed by the plaintiffs. He recommended the Commission approve construction between Wentzville and Route 77 in accordance with the engineer's survey. The recommendation was unanimously approved.[174]

Chief Engineer T. H. Cutler announced to the public that the project would be able to move forward. The last restraining lawsuit, filed in Cole County Circuit Court by J. Gates Williams in October 1931, had been withdrawn. Williams was quoted as saying he withdrew the suit "because [he] knew it was useless to fight the State's plan any longer."[175] T. H. Cutler estimated that the new superhighway would cost $3 million and that work would commence before the end of the year.[176]

Due to rising property prices and the possibility of large properties being subdivided, the State Highway Department began acquiring options on right of way required for the superhighway route through St. Louis County in 1935. To wait would increase costs because of the "innumerable hands" the property would be in.[177]

As the state began getting estimates for the right of way in 1936 the costs caused concern. The right of way between Bellefontaine and Route 77 was estimated to cost $431.91 an acre or $13,771.10 a mile; between Bellefontaine and Mason it was $430.65 an acre or $10,797.77 a mile. The members of the State Highway Commission decided to see the property personally before authorizing the expenditure.[178] After viewing the property, and reviewing a report on right of way costs prepared by the St. Louis Chamber of Commerce, the Commission authorized securing the right of way.[179]

In 1937 residents of Ladue again vigorously protested the plan to extend the superhighway through Ladue to connect it to the Oakland Expressway south of Forest Park in St. Louis City. The opponents were concerned the extension would change the residential character of the community and they would prefer the state to take ownership of Clayton Road and use it as part of the state highway system.[180] Two delegations appeared before the State Highway Commission meeting in April. One group, represented by S. B. McPheeters, Boyle Rhodes and William Reeder opposed the location recommended by the engineers through Ladue Village and urged that 40TR be located on Clayton Road. The second group, led by Mr. Shallcross, Neal Wood and Dean Hefferman opposed locating 40TR on Clayton Road.[181]

F. R. Windegger, the road engineer for Ladue Village, hoped to make a statement to the Commission representing the Village position, and sent a copy of the testimony he hoped to make to Governor Lloyd Stark. The Village preferred that the state build a parkway connection noting that a number of hazards lined Clayton Road including 41 entrances to private places, including a country club; 6 entrances to subdivisions; 2 major crossroads; 6 blind roads, including one with school traffic; 2 bridle paths; 1 church; 1 convent; 1 fire department; 1 established restaurant; 1 sandwich shop and a grocery store.[182]

The same month, the St. Louis County Court adopted a resolution urging the State Highway Commission to route the superhighway over Clayton Road rather than use the southern alternate that Harland Bartholomew had recommended. Residents of Ladue Village had appeared before the County Court asking for the County support saying it would be more appropriate than routing heavy traffic in a residential area.[183]

By May 1937 there were only two routes being studied by the State Highway Commission for the location of 40TR—the engineers surveyed line was the south route, and improving Clayton Road was the north route. Chief Engineer Carl Brown explained the differences between the two routes in a letter to H. G. Simpson:

> "There is only about one-tenth of a mile difference in the length of these two routes from the Belt route and U. S. 61, to their junction east of the North and South Road, the Clayton Road being a little shorter.

[183] "Urge Highway 40 Be Routed on Clayton Road." *Watchman Advocate*, 16 April 1937, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

"Clayton Road

This is, at present, a four lane road from North and South Road to a point near U. S. 61, and many homes have been located rather close to the present right-of-way, which is sixty feet wide. To widen this road with two additional lanes would bring the right-of-way line, in many cases, very close to some of these homes and would destroy a large amount of beautification and trees, for which many of these property owners have gone to great expense. When widened to six lanes, it would be almost a physical and financial impossibility to ever widen again, and the widening of this twenty to thirty feet on each side would undoubtedly be very expensive right of way.

"It would be practically impossible to separate grades with the Clayton Road and intersecting roads, such as Warson Road, Price Road, Lay Road, and McKnight Road, which cross it. The estimated cost for the right-of-way and grade separation at Clayton and North and South Road would undoubtedly be in the neighborhood of $350,000. Due to the narrow right-of-way, there would be many drives and roads leading into this road, which would be hazardous for motorists.

"South Road

The South Road is an entirely new location from U. S. 61 to its junction with Clayton Road, east of the North and South Road. It is planned for a 200 foot right-of-way with four lanes of traffic, two on each side of a thirty foot parkway center. This would leave sixty-five feet on each side from the outer edge of the pavement to the right-of-way line, which would allow additional traffic lanes to be constructed when necessary, without having to secure additional right-of-way and would also leave room for serve driveways which could be built when needed.

"It is planned to separate grades at U. S. 61, at the crossing of Clayton Road, at Warson Road, at Lay Road, and North and South Road, therefore, traffic on this route would not have to cross traffic on these main county roads.

"Due to this being a new location, there are only two or three houses which would have to be moved or where the right-of-way would come close to the improvement. The right-of-way for this route would not be as expensive as the right-of-way on Clayton Road.

"Conclusion

"If the South Road is constructed, Clayton Road would be adequate as at present built, to handle the local traffic, which will use this route, and the two roads would immediately have eight traffic lanes instead of six, which would be the case if the Clayton Road is selected and widened.

> "To make the Clayton Road in any way comparable by separating grades, as can be done on the South road, would for only two additional lanes be very much more expensive than construction the South route."[184]

At the May 11, 1937 meeting, the State Highway Commission designated the South route, as described by Carl Brown to H. G. Simpson as the location for the routing for U. S. 40 Traffic Relief Road.[185]

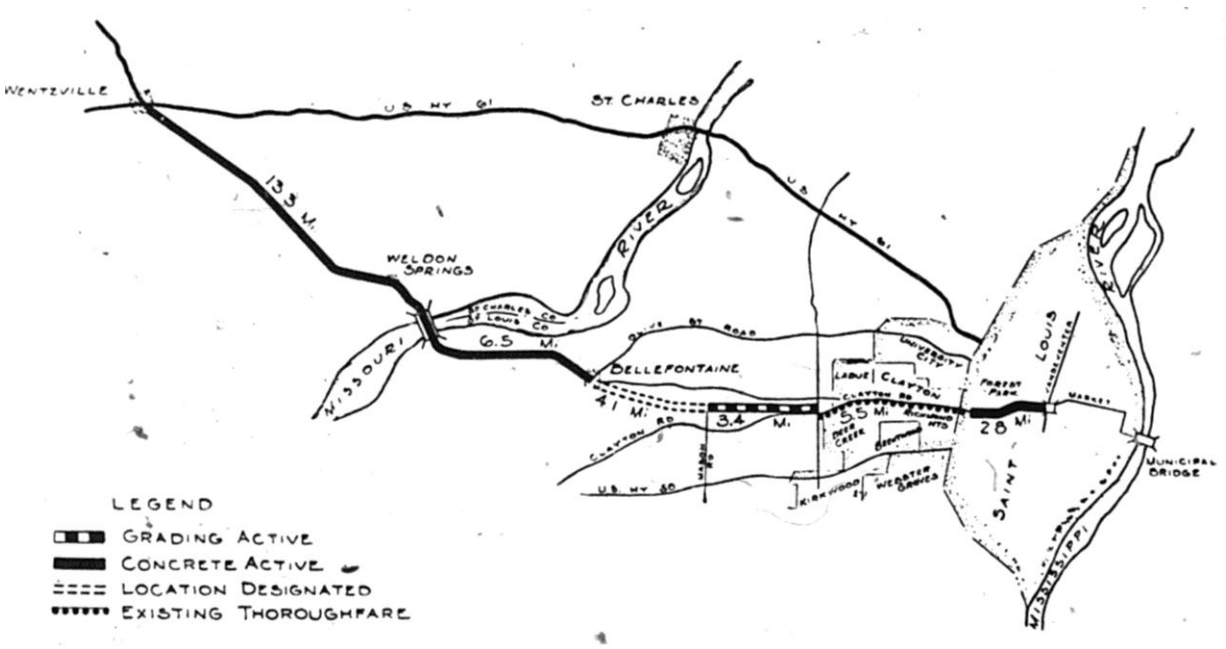

Figure 7: Map showing the location of the Superhighway in St. Louis & St. Charles Counties[186]

This option had been preferred by Harland Bartholomew and the State Highway Department. Large property owners had been fighting the route since 1929. The State Highway Commission issued a report saying it had considered four alternative routes over the course of their study, but had determined that the other routes would not provide the same level of service as the southern alternate or their cost would be out of proportion to the benefits of building the road.[187]

The State Highway Commission report continued by saying if the route was abandoned because a few landowners object, it would be reasonable to predict that objections will be made to other

highway projects, which will then be halted for the same reasons. The Commission said that "satisfying of individual desires would cast an intolerable burden on the taxpayers of the future" because it would leave substandard roads with heavy traffic, that would have to be accommodated in the future. They concluded by saying that "a few property owners should not be able to disrupt the arterial system of the city and county."[188]

Resolution of Legal Issues and the Continuation of Bridge Planning 1933-1935

Following the resolution of the injunctions against the superhighway project in 1933, planning on the road and bridge projects were able to move forward. Chief Engineer T. H. Cutler announced the State Highway Department would "start plans tomorrow morning [the morning after the last injunction was dropped] and hope to have construction underway before long."[189] Cutler hoped the plans for the new superhighway would be completed within the year, that the right of way would be acquired, and that the new bridge and part of the superhighway paving would be under contract. The plan was to acquire 200 feet of right of way as far west as Mason Road and 100 feet of right of way beyond there. The pavement would be 40 feet wide between the city limits and Bellefontaine, 30 feet wide between Bellefontaine and the new bridge, and 20 feet wide from the bridge to Wentzville.[190]

It was hoped that construction of the superhighway would greatly aid with the unemployment the county was experiencing. St. Charles City Clerk Henry Bloetamm and County Clerk Walter Borgelt, in cooperation with the State Highway Department, organized an unemployment league to obtain a list of all the unemployed residents of the county for future reference in hiring of highway projects. Applicants were classed according to their need, with married men with families given highest priority.[191]

Plans for the superhighway between the junction of highways 40/61 at Wentzville and Route 77 in St. Louis County were nearly complete in July 1933 and the right of way acquisition was beginning. The State would acquire the needed right of way through a combination of acquisition by deed (donation or small sum purchase by local supporters) or condemnation.[192]

Because of the workload of the State Highway Department Bridge Division, the Chief Engineer recommended that the work of preparing plans for the Weldon Spring Bridge be turned over to a firm of consulting engineers in August 1933. The National Recovery Act program had created a

[192] Missouri State Highway Commission. "Minutes of the Meeting of the State Highway Commission, held in Jefferson City, Missouri on July 11, 1933." pp. 20-21. As held by the Secretary to the Commission, Missouri Department of Transportation, Jefferson City, Missouri.

high workload, and the bridge plans could not be prepared in adequate time. Cutler recommended that the plans could be prepared on a fee basis of 3.5% of the estimated $750,000 cost of the bridge. The State Highway Commission indicated it preferred to have the bridge designed by the Department "because of the importance of this bridge."[193]

In September 1933 it was announced that highway supporters in St. Charles County had secured all the necessary parcels for the right of way, with the exception of one.[194]

In January 1934 the State Highway Commission approved a proposal to establish Route 40 Traffic Relief (40 TR) between St. Louis and Wentzville via Weldon Spring. The Wentzville Union reported:

> "By the action of the Commission a strong controversy has been settled, and we believe in the interest of the traveling public. This change will relieve the congestion and daily increasing dangers encountered on the narrow highway carrying a very heavy traffic.
>
> On the other hand the establishing of the new super-highway should mean a great deal to this community and may have important bearing on its growth and the development of industrial activity here."[195]

In February 1934 right of way for the new superhighway was being purchased by the State Highway Department. The purchase eased fears that the project might again be delayed, as the papers reported "there is no longer any doubt about the project being carried through at the earliest possible moment."[196] The plat of the superhighway location between Wentzville and Weldon Spring was filed in St. Charles County on March 21. The *Cosmos-Monitor* reported that almost all the right of way had been secured, meaning "the road is going to be built if it can be financed by federal aid."[197]

In March 1934 Cutler announced that contracts for construction of sections of the superhighway and the bridge would be let that year, provided that Congress passed legislation allocating additional funds to the state. The state had all the right of way in St. Charles County, except six parcels, and all the right of way in St. Louis County between the river and Bellefontaine except

for twelve parcels which would have to be condemned. The State Highway Department had received an extension from Congress on the authority to build the bridge, but construction had to start no later than 1936 and be completed by 1939.[198] The estimated cost was $3,045,000, which included $1,000,000 for the Missouri River Bridge.[199]

The inevitability of the superhighway and bridge construction became evident in August 1934 when the State Highway Department started condemnation proceedings in the St. Charles Circuit Court to obtain the right of way it had not already secured. According to the *Cosmos-Monitor*, immediate benefits were that the bridge would be built and a large number of people would have work on the road and bridge building jobs. The road would open up that part of the county and would mean a great deal to those it serves. The community of Wentzville would receive particular advantage from the construction:

> "It will mean more to Wentzville than to any other place in the county. There is not a place in the county with a brighter outlook before it then Wentzville. The new road will place Wentzville in a location where there will be a wonderful future for it as the terminal of present highway 40, the state highway and highway 61. Real estate values should take a boost there and a better investment could not be found."[200]

On October 31, 1934 the State Highway Department Right of Way and Legal Departments were at the Circuit Court leaving money for the restitution of those properties that had been condemned for the new superhighway. The community began anticipating that bids would be advertised for grading on the road at any time.[201]

In January 1935 the State Highway Department advertised for bidders for bridges and grading of the section of the superhighway between Wentzville and the Missouri River in St. Charles County and for bridges and grading in St. Louis County between the Missouri River and Bellefontaine Road. Plans for the bridge were expected to be completed in time for construction to begin the next spring, and it was expected to take between twelve and eighteen months to complete construction. The new highway would "provide an alternate route between Wentzville and St. Louis and will eliminate delays caused by traffic congestion on the present route through St. Charles" according to news articles at the time.[202]

[202] "Highway 40 Cutoff Work Begins Soon." *St. Charles Banner-News*, 17 January 1935, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

The *St. Louis Post-Dispatch* reported that bids on the three lane bridge at Weldon Spring would be accepted within the year since the State Highway Department and the Public Works Administration had reached agreement on the bridge and superhighway. According to the *Post-Dispatch* the "chief gain from this diversion will be avoidance of the St. Charles Bridge. This is not a modern structure, suitable for heavy automobile traffic."[203]

Bids for the 13-miles of grading, culverts and bridges between Bellefontaine in St. Louis County and Wentzville in St. Charles County (excepting the Weldon Spring Bridge) were opened on Saturday, January 26, 1935. This project was the largest road job in St. Charles County in several years and it was hoped that as many as 170 local men would find employment on the road.[204] The nine mile project in St. Charles County was divided into two projects, one 4.872 miles the other 4.167 miles.[205] Six additional miles of three lane road was located in St. Louis County.[206] A. W. Mosley and Boyle-Pryor Contractors of Kansas City were the successful bidders for the road project, with a bid of $127,923.20 and the associated bridges were awarded to F. T. Adell Construction of Hannibal for an additional $99,290.21. Contractors were prohibited by federal rules from hiring men from other counties, so 120 skilled and unskilled laborers from St. Charles County would be employed on the project.[207]

By January 1935 negotiations between the State Highway Department and the Public Works Administration over the width of the bridge were complete and plans were under review. The Public Works Administration had favored construction of a four lane bridge since it was on a superhighway that the State Highway Department was assuming would be widened in the future. The State Highway Department was insisting that a three lane bridge was sufficient since the superhighway was a three lane highway leading to the bridge on the south side and would be a two lane (and could be expanded to a three lane) highway on the north side. After considerable

negotiation the State Highway Department point of view was accepted.[208] The firm of Sverdrup & Parcel was retained to check the design of the bridge.[209]

Speaking to the Wentzville Community Club in February 1935, P. H. Daniells, Division Engineer of the St. Louis Division, said that the new 40 would shorted the route to St. Louis by 30 minutes. He also said that pouring concrete on the highway would not occur until the following year. He told the group that the plans for the three-lane bridge had been accepted and that nothing was holding up its construction.[210] In May 1935 the State Highway Department was announcing that bids for the new bridge would be called for within the next month.[211]

Chief Engineer T. H. Cutler announced that work on Traffic Relief 40 should be completed before the summer of 1937, in late October 1935. He also said the new bridge, estimated to cost more than $750,000 should be under contract in the next thirty to forty days.[212]

In November the call for bids for the bridge was announced. The bids would be received by the State Highway Commission for Project 40TR, Section 4, Project PWA-76, Docket 2981 in St. Louis and St. Charles Counties until 10:00 a.m. on November 26, 1935. The bid call included grading, constructing a bridge and any incidental work on the state road at Weldon Spring crossing the Missouri River.[213]

The Kansas City Bridge Company was the low bidder with a bid of $1,221,670. They expected to begin work within the next thirty to sixty days and work was expected to be completed by the spring of 1937.[214] Grading on the new road was almost done and culverts had been built. Many local farmers and farm boys had found work on the grading job. Building the bridge would require more skilled labor.[215]

In July 1936 contracts for paving the superhighway in St. Charles County between Wentzville and Weldon Springs were let. The concrete roadbed was to be twenty-one feet wide and was to be laid in such a way that it could be easily widened to a full three-lane highway in the future.[216] The Regenhardt Construction Company of Cape Girardeau was awarded the contract for $372,975. Paving had already been completed on the 6-1/2 miles between the bridge and Bellefontaine, and it was open to traffic.[217]

Construction of the Bridge 1935-1937

In May 1934 the State Highway Department was making soundings of the Missouri River to locate the best positions for the bridge piers.[218]

Since some funding for the bridge construction was coming from National Industrial Recovery Act programs (the Public Works Administration), there were several rules and regulations relating to work hours and wages that were included in the contract for the job. Federal requirements included provisions that:

- No convict labor would be employed on the project, and no materials manufactured by convict labor would be used in the project.
- A thirty-hour work week was imposed, except in executive, administrative and supervisory positions, no individual could work more than eight hours in a day, and work on Sunday and legal holidays was not permitted. This rule could be suspended, but only with the approval of the PWA.
- A federal wage scale for labor had to be used with skilled labor paid $1.10 per hour, semi-skilled labor paid 65 cents per hour and unskilled labor paid 45 cents per hour.
- A preference given to ex-service men with dependents.
- Human labor used over machinery whenever possible—examples included in clearing and grubbing and trimming of slopes and ditches.[219]

Skilled laborers were carpenters (including form builders), bricklayers, asphalt rakers, compressed air workers, machinists, blacksmiths and operators of power shovels. Semi-skilled workers included operators of derricks, paving mixers, drag lines, air compressors, pile drivers, hoists, tractors, jack hammers, graders, paving breakers, cranes, small concrete mixers, power rollers, painters, structural iron workers, carpenter's helpers, form setters, concrete finishers,

concrete spudders, timekeepers, truck drivers, pipe jointers, teamsters over 2-up, reinforcing steel placers, second class machinists and powder men. Unskilled laborers included concrete laborers, water boys, painter's helpers, pipe layers, teamsters 2-up, and night watchmen.[220]

The State Highway Department retained S. J. White to serve as project engineer for the Weldon Spring Bridge in November 1935. White had taken a leave of absence from the Department to serve as project engineer for the construction of the Hannibal Bridge over the Mississippi River. White was retained at a salary of $250 per month.[221] White reported to the job site on December 16.[222]

The Kansas City Bridge Company arrived on site December 20, 1935.[223] In December, January and February materials for the bridge arrived by barge and rail, and crews worked to unload those and to clear areas around the work site for the project office and tool shack and along the rail road right of way for a spur to piers 2 and 3. The weather was very cold, and in late January the river was frozen over.[224] Minimal engineering work occurring during the winter, the locations for piers 8 and 9 were identified and chaining and running levels across the frozen river was done.[225]

Kansas City Bridge Company Project Engineer H. P. Treadway reported that the company had begun assembling equipment and organizing work at the bridge site upon receipt of the notice to proceed. Unusually severe winter weather and river conditions were keeping them from being able to do much work. They had to suspend operations on January 20, 1936, and on February 14 they requested permission from the State Highway Department for an official suspension of their contract.[226] The suspension was not granted, Cutler informed Treadway that a break in the

weather was expected and if the company needed an extension of their contract later it would be sought from the federal government.[227]

To help prevent flooding damage to the bridge and the highway in the Missouri River floodplain on the St. Louis side of the River, the State Highway Department constructed a levee in 1936. The levee cost $8,000, with the levee district providing $1,000, and the St. Louis County Court providing $1,000. Flooding could cause "considerable damage…to Route 40TR" and the approaches to the Weldon Spring Bridge.[228]

The extremely cold weather ended on Friday, February 21, it was followed by mild weather. On February 26, 1936 workers began excavating at pier 9, and the ice in the river began to break up.[229] By the end of the month the river was completely clear of ice for the first time since work had begun at the site. Work continued at pier 9 and setting the upstream cofferdam began on March 2. At pier 3 work began driving a trestle.[230]

Labor trouble came to the bridge site in early March. The union representative for the carpenters and pile drivers union would not allow his workers to work on the north side of the bridge since there was one non-union carpenter working. This shut down carpentry work on the project for a week until the union decided to allow their men to work with non-union men.[231]

As March progressed the cofferdams for pier 9 were set and excavation inside was begun. Excavation was begun at pier 8 and abutment 1, they began to build a tramway to pier 7 and trestle work at pier 3 continued. Work crews of between 30 and 76 men occupied the site six days a week.[232]

The Kansas City Bridge Company received authorization to work on Sundays and holidays while sinking pneumatic caissons for pier bases 4, 5, 6 and 7, although individual workers still could not exceed the 30 hour work week.[233] The company also requested and received permission to

use machine tools to bore holes in the heavy timbering for the false work for the steel and the pier docks for the caissons. In the request, the company said they were not trying to get around the hand labor requirements, and understood the intent of the restrictions. They pointed out that hand boring heavy timber, like hand riveting, had become passé with the advent of machine tools and that workers were likely to foul a hole of any depth. They successfully argued that machine augers would save time, save an "excessive" amount of money over using an antiquated hand tool method, and be safer for workers.[234]

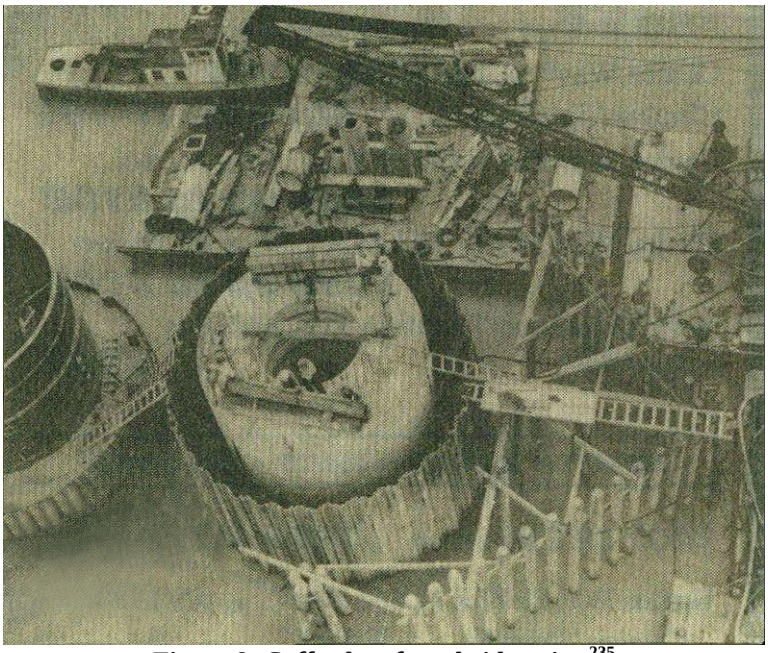

Figure 8: Cofferdam for a bridge pier.[235]

In April workers built a dock for pier 4, drove piles for pier 8, excavated for abutment 1 and pier 2 and worked on the mixing plant.[236] By mid-month they started dredging at pier 3 and had received the caisson for pier 4 and launched it, and had begun the cofferdam there.[237] On April 20 the dredgers reached rock on pier 3, the same week concrete pours began for the footings at pier 2 and the pilings were completed at pier 8.[238]

April 26 was the first Sunday that the Kansas City Bridge Company had a work crew on site, a crew of sand hogs, but did not put them to work, because the river was not considered high enough to cause an emergency.[239]

On April 27, 1936 S. J. White reported to Norman Sack that rock, satisfactory for footings, had been uncovered at abutment 1.[240] Concrete pours continued at piers 3 and 8, and excavation continued at abutment 1. Forms were being constructed at piers 2 and 4.[241]

By the first week of May the workers were ready to pour footings for pier 3, were pumping out pier 8, and the cutting edge of the caisson had reached rock on the north side of pier 4. Good progress was being made, but a rising river was making pouring concrete difficult.[242]

In early May P. H. Daniells, Division Engineer in the St. Louis District, wrote Chief Engineer Cutler that he and Mr. Kerby of the National Reemployment Services in charge of veterans had been discussing the labor at the Weldon Spring Bridge project. Kerby felt that there was labor difficulties on the project that needed to be brought to the attention of the Highway Department and that could potentially slow down the project.[243] The nature of these labor difficulties was not recorded in newspapers of the time or in Highway Department correspondence.

On May 4, 1936 the Bureau of Public Roads made an inspection at the Weldon Spring Bridge site. They found the overall quality of the work satisfactory and the rate of progress normal. They noted that work had practically shut down in January and February due to weather conditions. In work done to date they noted that abutment 1 the excavation had been completed; pier 2, concrete shafts had been poured to 19 feet above the top of the footing; pier 3, the steel sheet pile coffer dam was in place and excavation was made 2' into the rock; pier 4, the air caisson was partially sunk; pier 5, the guide piles were driven; pier 8, the steel piles were driven and the concrete seal poured; abutment 9, the excavation made and a test pile driven. They also noted work in progress on pier 3 (cleaning off rock bottom in preparation for pouring concrete) and pier 4 (excavation under air).[244]

Sand hogs had been on the work site since late April. Workers were paid more as they got deeper, and worked fewer hours as they got deeper because of increased air pressure (see Table 1 below). They worked in shifts. The majority of the 120 workers were African-Americans brought in from other parts of the state, although a call was made for local labor. All were required to pass a physical exam before they were allowed to work.[245]

Table 1. Hours and Pay Scale for Sand Hogs[246]

Between Depths	Hours Could Work	Pay Received per Hour
To 45 feet	8 hours	65¢
46-64 feet	6 hours	86-2/3¢
65-79 feet	4 hours	$1.40
80-95 feet	3 hours	$2.10
96-105 feet	2 hours	$3.75

The caisson for pier 6 arrived on May 9, and was launched on May 19. Other work being done in May included building forms at abutment 1 and pier 2, removing rock from pier 4, pouring the concrete for the icebreaker on pier 3 and capping the piles on pier 8. Rainy weather slowed progress slightly, and caused the formula of the cement being poured to be changed.[247] The last week of May the rainy weather ended and the workers made good progress completing the backwall of abutment 1 and pouring fourteen feet of shafts on pier 8. Pier 3 was poured to the bottom of the arch ring. Piers 4 and 8 were completed and the forms were removed. Iron workers began erecting false work for span one on May 28.[248]

In June the sand hogs were working at piers 6, and concrete pours continued. By the end of the month abutment 1 and piers 2 and 3 were complete, pier 4 had forms 75% complete and concrete 60% complete and pier 6 had 40% forms completed and 45% concrete complete, pier 8 and abutment 9 had all the pilings driven, forming was underway and about 50% of the concrete had been poured. Piers 5 and 7 had not been begun. Spans 1 and 2 were underway with the false work and steel erected and the riveting in both spans underway.[249] In mid-June steel work stopped until Pier 4 was complete.[250]

In July 1936 construction saw a delay when the steel gang working on the piers was temporarily laid off because necessary shipments of cement had not arrived.[251] Steel workers were not on the job site between mid-June and July 13.[252] By the end of July pier 4 and abutment 9 were completed, pier 5 had about 15% of the concrete poured, pier 6 had 70% of the concrete poured and pier 7 had not yet been started. The span 3 false work was about 50% complete and the steel was just beginning to be erected.[253]

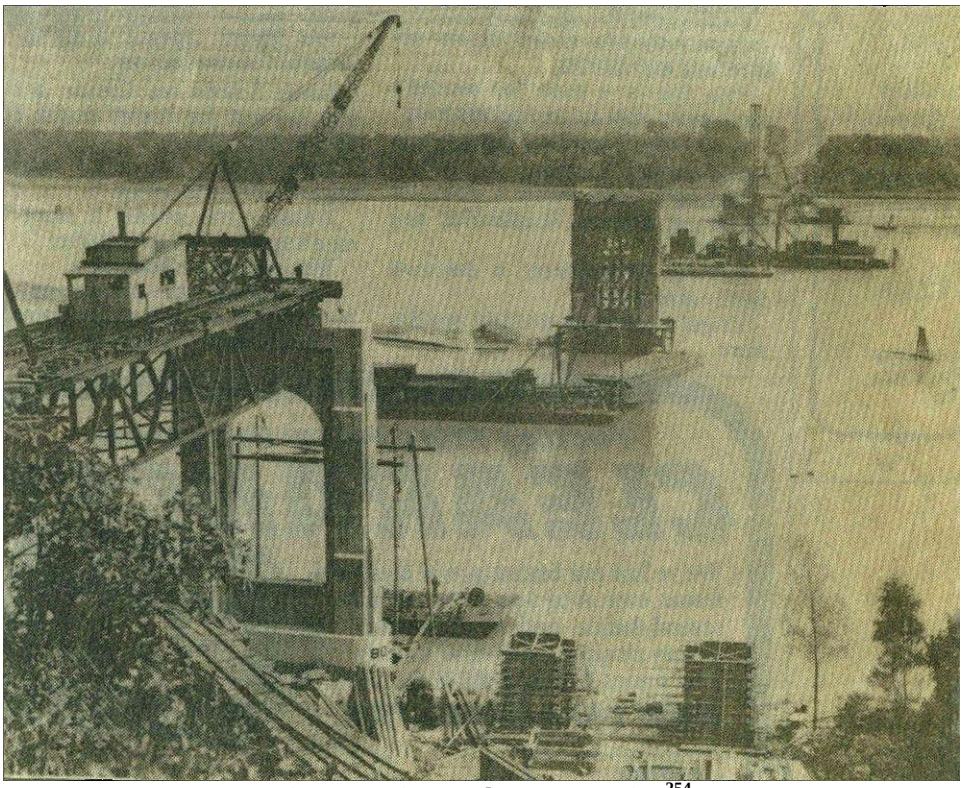

Figure 9: Piers under construction[254]

On July 11 the Kansas City Bridge Company requested permission to move from a thirty hour work week to a forty hour work week. They noted that the construction of the Wabash Railroad Bridge in St. Charles, another PWA project, would be utilizing a forty hour week. Since it was located close to a labor force, the existing thirty hour restriction would create a hardship in

obtaining labor for the project, which was sixteen miles from town.[255] Sack responded on the 13th by supplying a revision in hours of employment for skilled labor for Works Program projects. The policy allowed for the Chief of the Bureau of Public Roads to suspend the requirement for highway projects were a contractor was unable to get skilled labor because of the thirty hour week requirement upon application.[256]

On Thursday, July 30, 1936, Sylvester M. Park, a 27-year old carpenter on the bridge, fell 48 feet from the top of the forms for pier 6 to the sandbar below. During the fall he struck the top of the coffer dam, fracturing his skull, both legs above the knee, and his right arm; he died five hours later at St. Joseph's Hospital in St. Charles, the first casualty of bridge construction.[257]

Pier 7 was started the first week in August, the last of the substructure to be started. The work was "greatly handicapped" because low river levels made getting material loaded on barges difficult. [258] Iron work had progressed to erecting steel at span 4 and riveting span 3.[259]

August brought additional problems, as the upstream cylinder for pier 5 landed on rock but out of position nine inches upstream from the correct position. Since the extent of the displacement could not be corrected once the caisson reached bedrock it had to be accommodated in the pier design and seal.[260]

In late August falling river levels caused problems. On Sunday, August 9 an emergency situation arose when two large boats and one small boat with three barges were stuck in the chute where they were loading material for the piers. It was necessary to keep the boats moving to prevent them running aground, this was a labor violation, but had been necessary. It was a concern, because river levels continued to fall and the piers were not yet complete.[261]

[261] Corbett, J. J., Letter to Clifford Shoemaker, 22 August 1936. Construction file, Bridge J1000. Bridge Division, Missouri Department of Transportation, Jefferson City, Missouri.

The thirty hour work week was causing problems on the job site by the fall of 1936. The Kansas City Bridge Company requested permission for workers to work a longer week, but since the requirement was federal it required an exemption from the Bureau of Public Roads. The request was forwarded on September 14.[262]

In early October S. J. White reported that the contractor had been delayed due to a shortage of three drum hoisting engineers and structural steel workers. He also reported that the contractor had been erecting steel with four man crews where they needed an eight man crew, or more. They also had not had enough riveters on site since construction began.[263] Two weeks later White reported delays due to a shortage of head mechanics—electric welders that had passed a state examination. Twenty were needed for the project. The contractor had furnished two, the Missouri State Employment Service had provided three and the National Reemployment Service had provided one. The contractor had located five more in Kansas City, but because of the Public Works Administration 30 hour work week requirement, and a 32 mile drive from St. Charles to get to the job site, they would not report to the Weldon Spring site. White reported the St. Louis welders were also objecting to a five hour work day after a 90 minute drive to the site.[264]

In September work began on span 4-5 of the bridge, and continued on span2-3. Fair progress was being made on the bridge, with the substructure 81% complete the week of September 17. That week pier 5 was completed.[265] In mid-October the weekly report indicated that pier 7 was still being excavated, pier 8 still had form work being done, and abutments 1 and 9, and piers 2, 3, 4, 5 and 6 were complete. The false work of spans 1-2, 2-3, 3-4 and 4-5 was complete the steel erected, and false work was started on span 5-6.[266] Workers had also starting to weld the floor in the spans.[267]

Because the State Highway Department did not have a bridge inspector available to inspect the superstructure of the bridge, they made arrangements with Sverdrup & Parcel to provide a bridge inspector while the superstructure was being erected.[268]

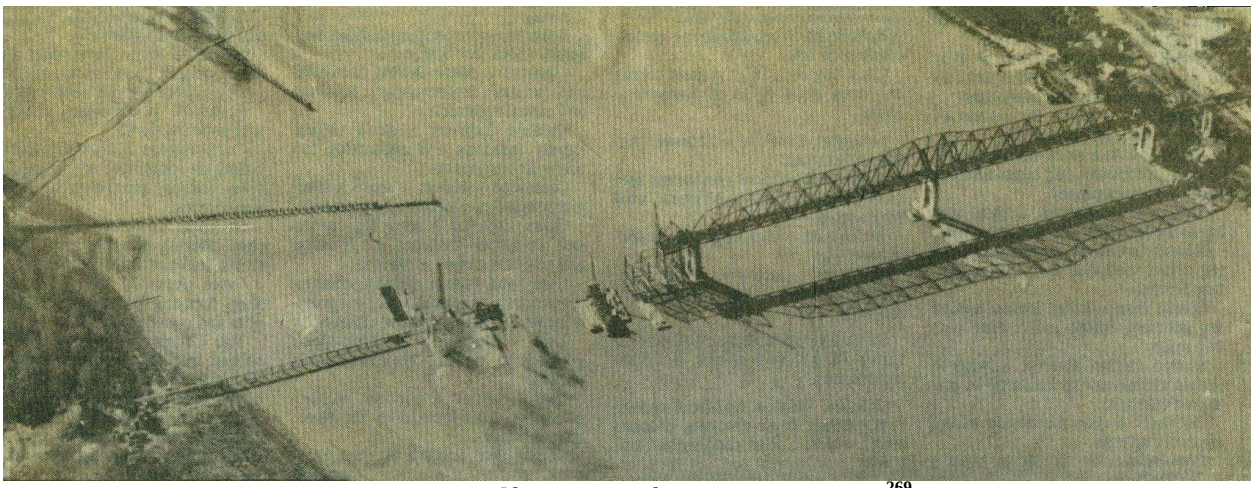

Figure 10: Halfway point of Truss Construction[269]

In mid-December 1936 work on the Weldon Spring Bridge stopped for the winter. Piers had been completed and concrete poured for some of the piers. Because of falling temperatures, no further work would be done until the following spring.[270]

The bridge was included in the State Highway Commission's *Tenth Biennial Report* as an example of the major bridges the Bridge Division had been working on during the previous period. The bridge was described as being 2,614 feet in length with a superstructure consisting of two 145-foot and two 130-foot deck trusses and two 2-span continuous through trusses. All the foundations were concrete piers and bents carried to rock with the exception of the two south bents, which rest on steel piling. The total cost of the bridge was $1,213,548.[271]

On April 27, 1937, Carl Brown, Chief Engineer of the State Highway Department, announced that a 20-mile section of the new superhighway between Wentzville and Bellefontaine Road, including the new Missouri River Bridge at Weldon Spring would open to traffic in June.[272] The steel work on the bridge was complete and laying the concrete floor would begin within the

week. Painting the bridge would begin within the next two weeks. No date had been set, but it would not be before the middle of May.[273]

The early June opening of the bridge was postponed as workers painted the bridge spans.[274]

Naming the Bridge

In September 1936 the Editor of the *Missouri Motor News*, George Marsh, sent a letter to the State Highway Department inquiring about the progress of the Weldon Spring Bridge. In the letter he asked if a name had been chosen. He said "Weldon" or "Weldon Springs" would make logical sense since Weldon is the name of an early pioneer family contemporary with Daniel Boone. He wrote, "If a name has not already been decided I would like to suggest the use of it at this time."[275]

The Automobile Club of Missouri sent a letter to the State Highway Commission requesting the Weldon Spring Bridge be officially named the Daniel Boone Bridge, offering to provide nameplates for the bridge. Chief Engineer Carl Brown presented the proposal to the State Highway Commission at the April 13, 1937 meeting. The Commission held the matter for further consideration.[276]

The Chief Engineer explained there was no precedent set for naming a bridge—the Commission was on record as being opposed to giving names to highway and "tried to inform the traveling public of routes by numbers." The Public Works Administration also took a great deal of interest when "matters of this kind" are proposed by a state. The Commission thought it advisable not to take any action on officially naming the bridge, but "had no objection to the local people identifying this bridge by any unofficial name they preferred."[277]

In mid-June it was announced that the bridge would be known as the Daniel Boone Bridge, and would be officially opened to traffic on June 27 at 2:30. Governor and Mrs. Lloyd C. Stark, members of the State Highway Commission and others would take part in the ceremony, which would include an all day picnic in Wentzville. Other activities would include a barbeque, a

program of speeches, afternoon entertainment, and conclude with an outdoor dance in the evening. The program was sponsored and managed by the Wentzville Community Club. The organizing committees were preparing for a crowd of 10,000.[278]

The suggestion for the name, Daniel Boone, had come from Colonel Francis M. Curlee, owner of the Nathan Boone home in Femme Osage. The Automobile Club of Missouri adopted and promoted the idea and urged the State Highway Department to accept the name.[279] There was great local support for the name, with one editor opining "the settlement of the northern part of Missouri and the great West virtually began in St. Charles County as a result of the work done by Daniel Boone. We sincerely hope the State Highway Commission will see the justice and appropriateness of the request…and name the Weldon Spring Bridge accordingly."[280]

The State Highway Commission let it be known that it had no objections to letting the bridge be known by the name "Daniel Boone Bridge" but that it, by policy, did not designate bridges by name.[281]

Bridge Dedication

The dedication was to take place at the bridge approach and at Wentzville. Plans were for a procession to meet Governor Stark at the junction of highway 40 and the cutoff at 2:00 and arrive at the bridge site at 2:15. The Jefferson Barracks Band would give a concert followed by a Dedication address by Governor Stark and the ribbon cutting by Mrs. Stark. A parade of cars across the bridge would be formed and would proceed to the recreation park for additional addresses, concerts and a dance.[282] During the dedication a squadron of planes from the Missouri National Guard would fly in formation over the bridge and the superhighway.[283]

The St. Charles County Court declared June 26 a legal holiday with all public offices closed, except the Collector's Office, and issued a proclamation:

> "WHEREAS, Saturday, June 26, 1937 has been selected as the day for the official opening and dedication of the Weldon Spring Bridge across the Missouri River

and the new concrete highway extending from the West end of the bridge to Wentzville, and

"WHEREAS, the opening of this bridge and highway will be an event of great importance to St. Charles County and many of our citizens are desirous of attending the opening ceremonies at the bridge and the celebration to be held immediately afterword at Wentzville,

"NOW THEREFORE, We, the undersigned Judges of the St. Charles County Court do hereby declare the afternoon of Saturday, June 26, 1937, a holiday, and request the various county offices to enable as many as desire to attend the ceremonies.

"IN TESTEMONY WHEREOF, we have hereunto affixed our signatures this 22nd day of June, 1937.

Signed: Henry F. Ohlm, Presiding Judge
Henry S. Hoffman, Judge Western District
J. L. Rothermich, Judge Eastern District"[284]

About 2,500 people attended the dedication of the bridge. Governor Stark and Major Robert B. Brooks of the State Highway Department delivered addresses and at 3:00 in the afternoon Mrs. Stark cut a white ribbon across the middle of the bridge, allowing hundreds of cars to make the first trip across the $1,250,000 span. Among the dignitaries in attendance were Mayor Bernard Dickman of St. Louis, Mayor Charley Kansteiner of St. Charles and other city and county officials.[285]

In his address Governor Stark complimented St. Charles County people on the name of the new bridge, and reviewed some of the highlights of the pioneer's life. Among those in attendance were descendents, including a two-year old Daniel Boone.[286] Governor Stark described the bridge as the "last word" in bridge construction, and since it carried two national routes (40 and 61) it would reach all over the nation. The bridge was the most expense bridge constructed by the State Highway Department as well as the widest across the Missouri River, except for the A. S. B. Bridge in Kansas City. It was the thirteenth free bridge across the river between St. Joseph and the mouth of the river and the seventeenth bridge across the river in Missouri.[287]

Major Brooks spoke of the improvements that had been made in the St. Louis and St. Charles area, including the freeing of the St. Charles Bridge, and the relocation of the St. Charles streetcar line, which will enable an additional lane to be constructed on the highway in the coming year.[288] Sam Rudder, Assistant Chief Engineer of the State Highway Department, said there was enough concrete in the bridge to pave seven miles of two-lane road and ten million pounds of steel. The Public Works Administration funded about 30% of the construction costs of the bridge.[289]

After the addresses the cars formed a parade across the bridge into St. Louis County. Many returned to Wentzville for additional celebrations, others toured a new "loop" drive—the route over the (old) existing "highway to St. Charles, through to Wentzville and back to St. Louis County over the new route. Filling station attendants west of St. Charles reported exceptionally good business yesterday from those who took the trip."[290]

As the Daniel Boone Bridge was dedicated, the editor of *The Wentzville Union* wrote that the dedication marked a milestone. He urged readers to be proud of the State Highway Department "whose officials cannot be swerved from the pathway of common sense and the best interests of our state highway system." He noted that the Department had not had an easy time in building the superhighway and bridge. St. Charles had wanted them to widen the existing route, St. Louis wanted a "wide highway and a short-cut" to Kansas City. St. Charles "tried hard to stop the building of the superhighway and bridge." The battle continued for several years, but the State Highway Department "recognized the fact that our highway system cannot be made subject to local objections or financial gain sought by especially affected sections."[291]

Effects of Bridge Construction

By early 1937, even before the bridge and superhighway had opened, effects were being felt in western St. Charles County. It was reported that there was a demand for real estate in the townships the superhighway passed through and that land values were booming. Several large transactions were completed in the early weeks of the year in the district and a new filling station and restaurant were under construction at the junction of highway 40 and the spur highway in Wentzville. *The Wentzville Union* reported that "houses in Wentzville are at a premium and demand is growing steadily."[292]

[292] "Building on Highway Begins." *The Wentzville Union,* 12 March 1937, p. 1. Microfilm, State Historical Society of Missouri, Columbia, Missouri.

The Editor of *The Wentzville Union* speculated that the third lane of the superhighway would be laid out in St. Charles county "before winter sets in" because it is expected to be very popular.[293]

Less than a month after the bridge had opened, on July 11, 1937, Theodora C. Duncan of St. Louis became the first bridge suicide when she jumped from the center span of the bridge and drowned in the Missouri River.[294]

Weldon Spring Ordnance Works

In 1940 it was announced that a large TNT plant would be constructed at Weldon Spring. The location was ideal because of proximity to rail and water transportation for the product and water for the production of the TNT. Since the construction of the Daniel Boone Bridge, a large labor supply was easily accessible from St. Louis. It was estimated that the plant would employ 10,000 people.[295] The construction of this plant would change the character of this part of St. Charles County forever.

On September 9, 1940 the Congress passed Public Law 781 giving authority to the War Department to spend over $540 million for ordnance services and supplies, and authorized the Secretary of War to enter into contracts for an additional $902 million for ordnance services and supplies before July 1, 1941.[296] On October 17, 1940 President Franklin Roosevelt authorized a plant at Weldon Spring, Missouri, at an estimated cost of $14,500,000.[297]

On October 23, 1940 the War Department issued a press release announcing that Weldon Spring had been selected for a TNT and DNT plant. The announcement stated that agents had been ordered to proceed with the purchase of approximately 18,000 acres of land that would be needed by the government.[298] Most of the workers needed for the plant, 800 for the construction of the plant and 10,000 when production was at full capacity, would come from St. Louis and the

surrounding area. Every employable person in St. Charley County would be working by the time all the units were constructed.[299]

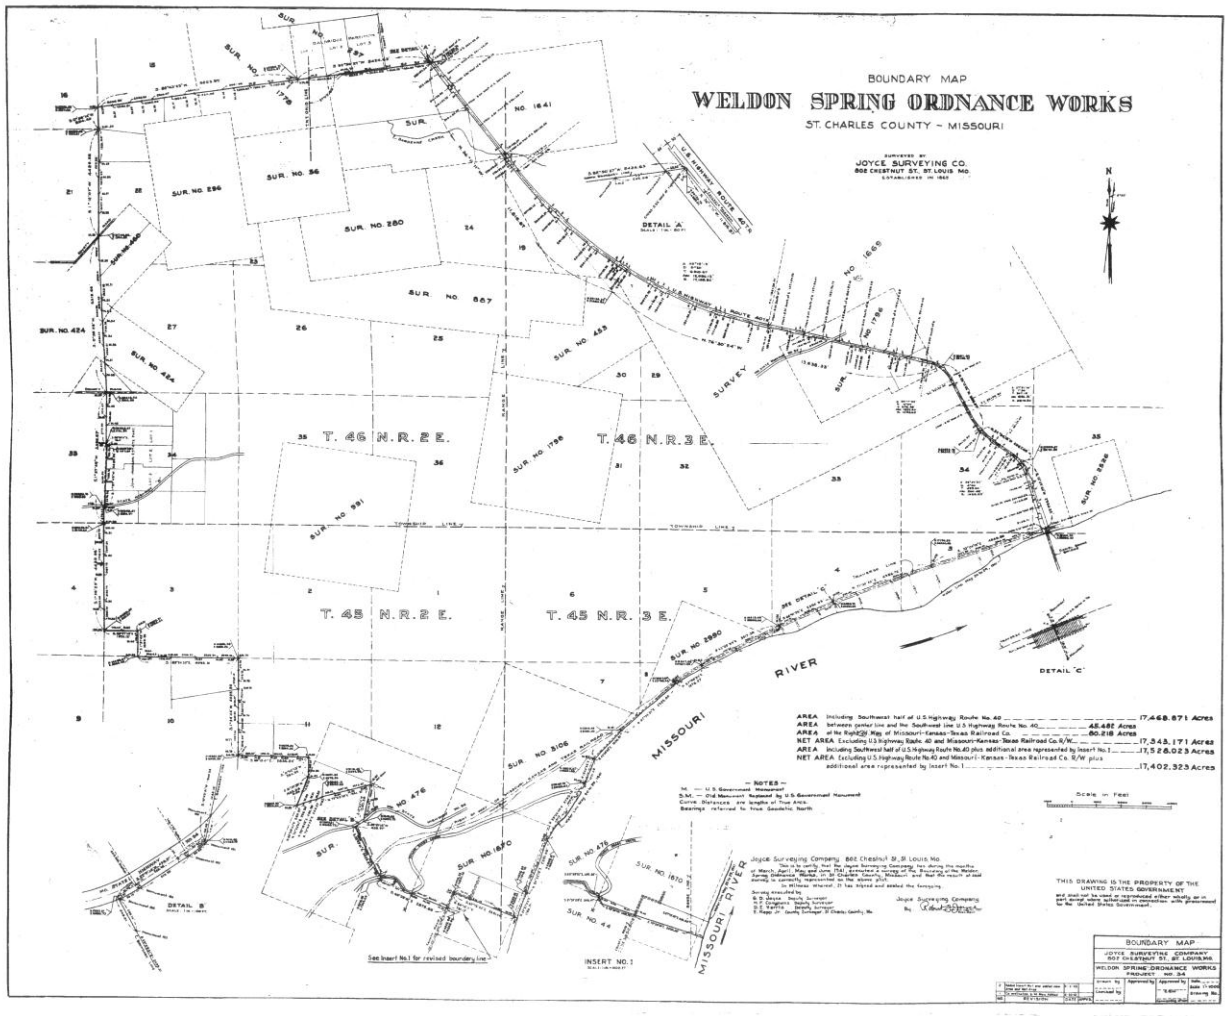

Figure 11: Weldon Spring Ordnance Works Boundary[300]

At a protest meeting held by area farmers in early November, Congressman Clarence Cannon had explained the rationale behind the War Department siting of the plant, saying "such plants must be far away from the sea coasts and boarders beyond the reach of enemy planes, near great rivers for the needed supply of water, near highway, railroad and waterway transportation and close enough to a great city for labor and materials."[301] By November 28 almost all of the 270 tracts the government wanted were under option by R. Newton McDowell, the government

contractor for the acquisition. Displaced residents started auctioning their personal property and moving from the area.[302]

Ground was broken for the Ordinance Works on November 28, 1940, and crews worked around the clock in three shifts until November 1, 1942 to complete the plant, which included over 1,038 buildings, 114 miles of roads, 23.38 miles of railroad, 9 miles of tram tracks, 20 miles of sewers, 55 miles of water lines, 63 miles of fencing, 25 miles of electric lines and 125 miles of electric distribution lines and many other features needed for production.[303]

At the height of production, the Weldon Spring Ordinance Works could produce, in a 24-hour period over one million pounds of TNT and ammonia oxidation, forty thousand pounds of DNT, 800,000 pounds of nitric concentration, and four million pounds of sulfuric concentration.[304]

The Weldon Spring Ordinance Works received word that the plant would suspend production in 1944 due to improved production process at other plants and a huge surplus of TNT. Production officially terminated on August 15, 1945.[305]

After the Ordinance Works features were destroyed, the acreage was sold. Seven thousand acres was donated to the Missouri Department of Conservation, due to a donation made by Mrs. August A. Busch, Sr., that land became the August A. Busch Wildlife Area. The University of Missouri acquired 7,900 acres for an experimental farm; those acres are now the Weldon Spring Conservation Management Area. The staff housing was sold as a single unit as auction. The Army reserved 200 acres.[306]

Post-War St. Charles County

The construction of the Daniel Boone Bridge and the superhighway contributed to the expanding population growth in St. Charles County. The bridge and highway provided easy access to the St. Louis metropolitan area, as demonstrated by the growth in the along the corridor, especially after World War II.

Bridge Rehabilitations and Construction of the New Bridge

In October 1978 controlled reversible lane markers were installed on the bridge. The controls had green arrows above the lanes traffic was to use and a red "x" above the lanes traffic was not to use. Prior to the installation of these controls the third lane on the bridge was used as a passing lane for traffic going either direction, with the controls rush hour traffic would be given two lanes in the direction of heaviest traffic flow and one lane in the other direction.[310]

In July 1983 work began on a companion bridge upstream from the Daniel Boone Bridge.[311] The new bridge opened on August 10, 1989 and the Daniel Boone Bridge was closed for a year for rehabilitation, including replacement of the bridge deck.[312] When the Daniel Boone Bridge reopened, it carried west-bound traffic.

Bridge Design and Construction Contractors

State Highway Department, Bridge Division

The Bridge Bureau of the State Highway Department was formed in 1918 and was given the task of preparing bridge specifications, standard and special plans and designs, estimating the cost of structures, checking shop drawings and checking change orders. The standard bridge designs

were for bridges on both the state highway system as well as for county roads.[313] As the Bureau of Bridges grew, additional responsibilities were acquired, including inspecting bridges and overseeing the construction of large bridge projects. In 1923 and 1924 the Bureau oversaw the construction of the Gasconade River Bridge and four Missouri River bridges (Lexington, Waverly, Boonville, and Glasgow).[314]

In the first decade of the existence of the Bridge Bureau it produced standard designs for concrete culverts, concrete bridges and steel bridges, special designs for 1,640 bridges and a Manual of Bridge Construction for project engineers and bridge inspectors.[315]

By the late 1920s the Traffic Relief highways in Kansas City and St. Louis were presenting special challenges to the Bridge Bureau. Bridges for these highways not only had to cross streams but included grade separations for railroads and grade separations for major highway intersections. Challenges included wider roadway widths, providing for the passage of traffic from one roadway to another and special consideration given to aesthetics for the structures.[316]

The same time period also had the Bureau developing new standard bridge designs for the new supplementary highway system. These roads had the same road width as the primary highways, twenty feet, but did not have to have the load capacity, which reduced their cost.[317]

The State Highway Department Bridge Bureau designed the Daniel Boone Bridge and acted as general overseer for the construction of the bridge.

Kansas City Bridge Company

The Kansas City Bridge Company had been formed in 1893 by Paul H. Everhard, Edward B. Watts, Reuben D. Swainn, and Frank N. Chick of Kansas City, Missouri and William W. Miller of Osage City, Kansas. They incorporated as the "Kansas City Bridge Company" with the purpose to "work in wood and iron, to design, build and sell railway and highway bridges and all kinds of structural work."[318]

Joseph W. Hoover was the first president of the Kansas City Bridge Company, and served in that position from 1893 until before 1912. By 1912 Alexander Mainland, Junior had become the president of the Kansas City Bridge Company.[319]

The Kansas City Bridge Company constructed a number of iron bridges around Missouri and the Middle West in the early twentieth century. The bridges constructed included small stream crossings and large structures over the Missouri River.[320]

The company was originally chartered to exist for 50 years but this article of the incorporation was amended in 1933, along with the purpose of the business.[321] The business expanded to provide general engineering and contracting work for buildings, roads and highways, bridges and bridge piers, manufacturing plants, mines and mine shafts, drainage and irrigation systems, and railroads and railway structures. This amendment also made the company a perpetual entity, removing the 50 year life span of the original charter.[322]

In 1953 the company charter was amended again, the revised articles of incorporation restated the general business practices that the company had been involved with to date. The common stock of the company was also reallocated to recapitalize the company.[323] In 2000 the Kansas City Bridge Company was dissolved by an act of the shareholders.[324]

The Kansas City Bridge Company constructed the substructure and superstructure of the Daniel Boone Bridge.

Sverdrup & Parcel

The firm of Sverdrup & Parcel was formally founded on April 1, 1928 by Leif J. "Jack" Sverdrup and John Ira Parcel. The first commission for the company was the design and construction of the Missouri River crossing at Herman Missouri.[325] Sverdrup had been the

Bridge Engineer for the Missouri State Highway Department for several years before he left to form the company and Parcel was a professor of engineering at the University of Minnesota, where he had taught Sverdrup.[326] Sverdrup decided to headquarter the company in St. Louis because it was close to the three major American rivers, was home to several railroads, and because it had no other bridge engineering firm located there.[327]

Sverdrup & Parcel did preliminary site work for the bridge and provided bridge inspection services.

Description of Bridge J1000

Bridge J1000 is a steel, rigid-connected, four-span, cantilever through truss with a polygonal top chord and a Warren web, with four deck truss approach spans with Warren web. The bridge has reinforced concrete abutments and piers with art deco detailing. The bridge has a total length of 2614 feet, individual span lengths are noted in the table below. Spans are numbered from the north (St. Charles County side) to the south (St. Louis County side); the configuration is shown on sheet 1 of the accompanying plans, found in Appendix A. Appendix B contains plates showing general photographs and detail photographs of the bridge.

Table 3. Span Configuration and Length

Span	Span Type	Span Configuration	Span Length
1	Approach	Deck Truss	146’ 0 ¼”
2	Approach	Deck Truss	147’ 7 ½”
3	Main	Through Truss	512’ 6”
4	Main	Through Truss	513’ 5 ½”
5	Main	Through Truss	513’ 3 ¾”
6	Main	Through Truss	512’ 0 ½”
7	Approach	Deck Truss	131’ 1 ¼”
8	Approach	Deck Truss	131’ 5”

The bridge substructure consists of reinforced concrete abutments and reinforced concrete dumbbell and flow-through piers. Dumbbell bents (2 and 8) and piers 3 and 7 have a solid web. These are shown on pages 7 and 8 of the plans in Appendix A and plates 11, 14, 15 and 16 in Appendix B. Piers 4, 5 and 6 have a single arched opening and have Art Deco influenced detailing including stepped detailing on the pier columns. These piers are shown on pages 4, 5 and 6 of the plans in Appendix A and plates 18 and 22 in Appendix B.

The bridge has four through truss spans, symmetrical around the center point of the bridge. Each truss has sixteen panels, at the bottom chord the side panels are each 32-foot wide and contain a diagonal member forming the Warren web. Details of the truss construction are in plans in

[326] Franzwa, pp. 2-9.

[327] Franzwa, p. 11.

Appendix A, multiple views of the through truss, including details of the connections, are found in Appendix B.

The bridge has a deck width of 34 feet. The vertical clearance is 14 feet 2 inches. The sway bracing is an "X" form with a vertical stabilizer dividing the bottom quadrant. Views of the portal bracing and sway bracing are found in plates 6, 8, 9 and 19 in Appendix B.

The portal bracing has been modified by the removal of knee braces and the placement of a horizontal member at the bottom of the chord. The photograph below shows the St. Louis end of the bridge before the change was made.

Figure 12: Daniel Boone Bridge, showing original configuration of portal bracing.

Photographic Methods and Processing

The archival photographs accompanying this documentation were taken and processed according to the standards for photographs accompanying National Register of Historic Places (NRHP) documentation.[328]

Aerial photographs are being used to fulfill part of the mitigation requirements for this bridge. These images were taken by Cathy Morrison on June 4, 2010 and December 16, 2011 using a Nikon D300 camera. These images were captured in a jpeg format, which has been converted to a tagged image file format (.tiff) and printed. This process is an "acceptable" practice according

[328] National Park Service. "Proposed Updated Photographic Policy National Register of Historic Places." Downloaded 8 June 2008 from: www.nps.gov/history/nr/policyexpansion.html.

to the National Register Photo Policy.[329] Karen Daniels took photographs on January 8, 2013 using a Canon G10 digital camera. Images were captured in a raw (cr2) format, which was manipulated for light contrast before being converted to a .tiff and printed.

Prints were made on Epson Premium Glossy Photo Paper and used Epson Matte Black Ultra Chrome K3 Ink, both identified as "best" practices by the NRHP photo policy[330], and which Epson identifies as having 85-year permanence under glass.[331] Kept in archival conditions the materials will exceed the 75 year permanence standard for the NRHP, which is the standard being used for this project.

All images were numbered according to the NRHP Photographic Imaging Policy[332] and burned onto a Delkin Archival Gold compact disc, which was provided to the SHPO along with this report. A copy of the photographs and .tiff images on an archival compact disc will also be maintained by the MoDOT Historic Preservation Section.

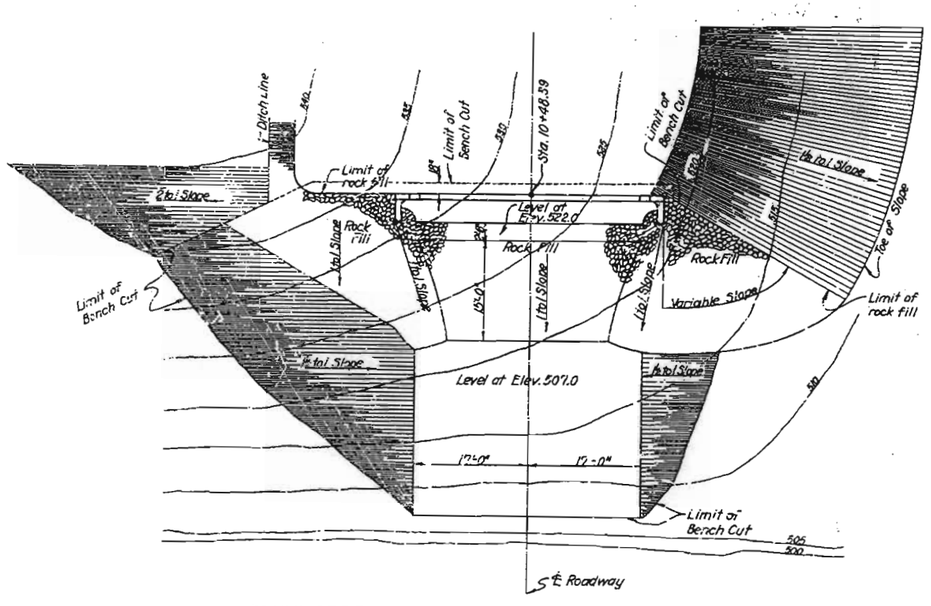
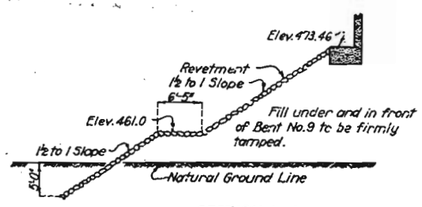
LOG OF SOUNDINGS

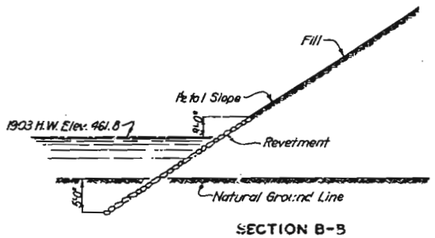


DETAIL OF BENCH CUT AND ROCK FILL AT BENT NO. 1

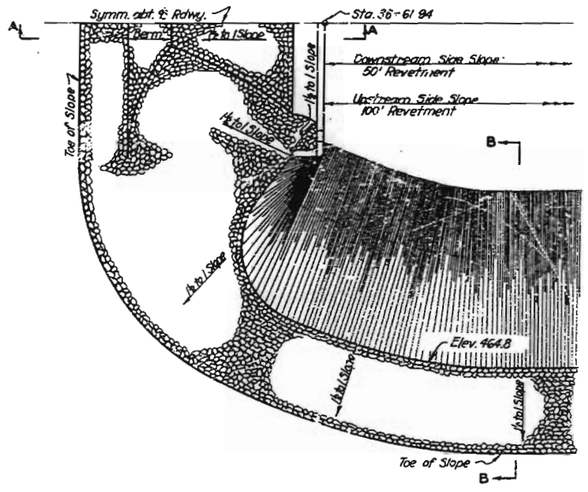
Note:- Bench cut and rock fill at Bent No. 1 as shown in detail.
Approximately 860 cubic yards of excavation and 130 cubic yards of rock fill.
All earth to be removed down to rock before building rock fill.
Excavation required for Bent No. 1 below Elev. 522.0 will be paid for as Bridge Excavation.
See Special Provisions.
Approximately 130 cubic yards of rock fill to be included in Roadway Quantities.



SECTION A-A



SECTION B-B



DETAILS OF HEAVY STONE REVETMENT AT BENT NO. 9

Note:- Heavy stone revetment shall be placed on fill at Bent No. 9 as shown in details.
Approximately 950 square yards of revetment work included in road contract.

Note:- This drawing is not to scale. Follow dimensions.

FINAL PLANS

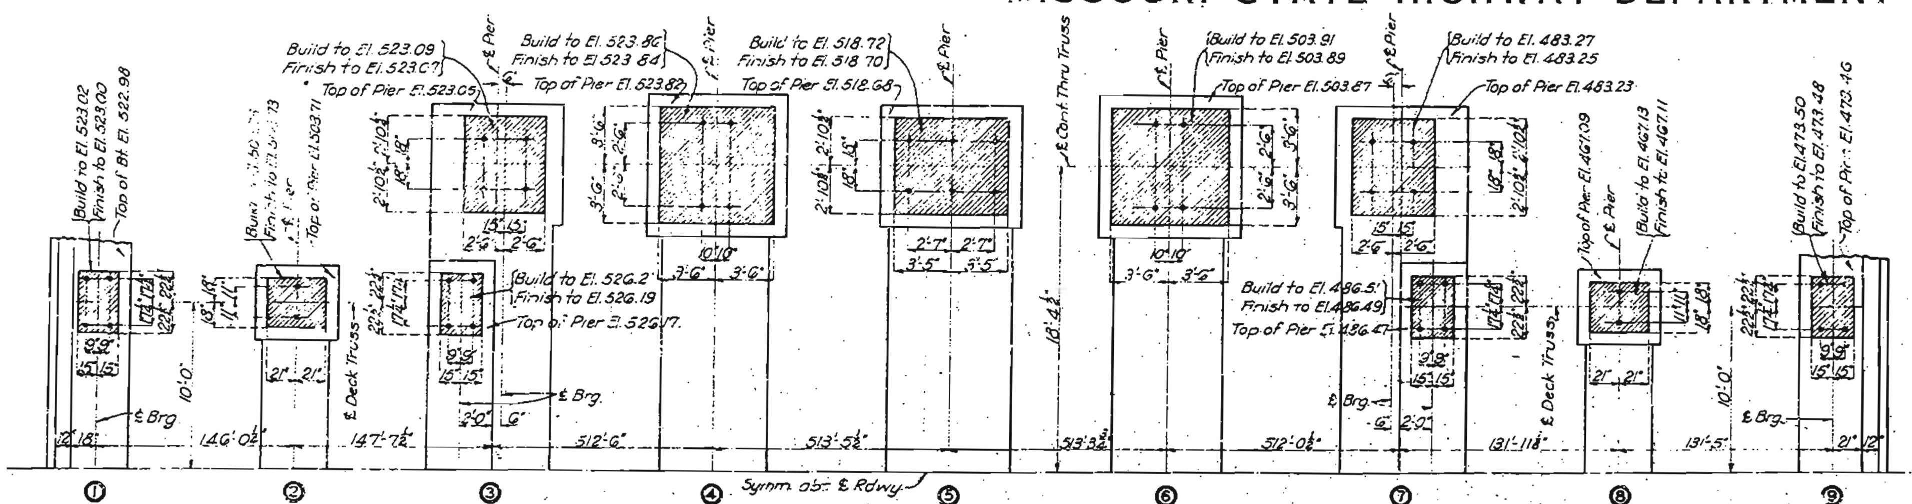
FED. ROAD DIST. NO.	STATE	FED. AID PROJ. NO.	FISCAL YEAR	SHEET NO.	SHS.
5	MO.	PWA 76 (US40TR-54) Docket #2981	19		

INSTRUCTIONS FOR PREPARATION OF SHOE SEATS:

Substructure contractor shall place and protect anchor bolt wells, see Special Provisions. Substructure contractor shall build tops of bents and piers to elevations given and the raised shaded areas to not less than the elevations given on the anchor bolt plan. These shaded areas shall be monolithic with the bent or pier cap.

The superstructure contractor shall grind these areas down to the elevation given for finish on the anchor bolt plan, and set the shoe bases on 1/8" lead sheets in accordance with the Special Provisions.

All shoe bases shall be set to dimensions given on anchor bolt plan.



HALF ANCHOR BOLT PLAN

Reinf. Steel Notes:–
Bars in substructure units to be billed and tagged separately.
Dimensions given are along ℄ of bars and are for computed lengths.
Reinforcing bars 3/4" or over in diameter, which are bent to an angle greater than 90°, shall be of structural grade.

SUBSTRUCTURE BILL OF REINFORCING STEEL

HALF ANCHOR BOLT PLAN

INSTRUCTIONS FOR PREPARATION OF SHOE SEATS:

Substructure contractor shall place and protect anchor bolt wells, see Special Provisions. Substructure contractor shall build tops of bents and piers to elevations given and the raised shaded areas to not less than the elevations given on the anchor bolt plan. These shaded areas shall be monolithic with the bent or pier cap.

The superstructure contractor shall grind these areas down to the elevation given for finish on the anchor bolt plan, and set the shoe bases on ⅛" lead sheets in accordance with the Special Provisions.

All shoe bases shall be set to dimensions given on anchor bolt plan.

Reinf. Steel Notes:–

Bars in substructure units to be billed and tagged separately.

Dimensions given are along ℄ of bars and are for computed lengths.

Reinforcing bars ¾" or over in diameter, which are bent to an angle greater than 90°, shall be of structural grade.

SUBSTRUCTURE BILL OF REINFORCING STEEL

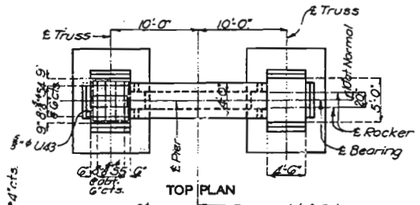
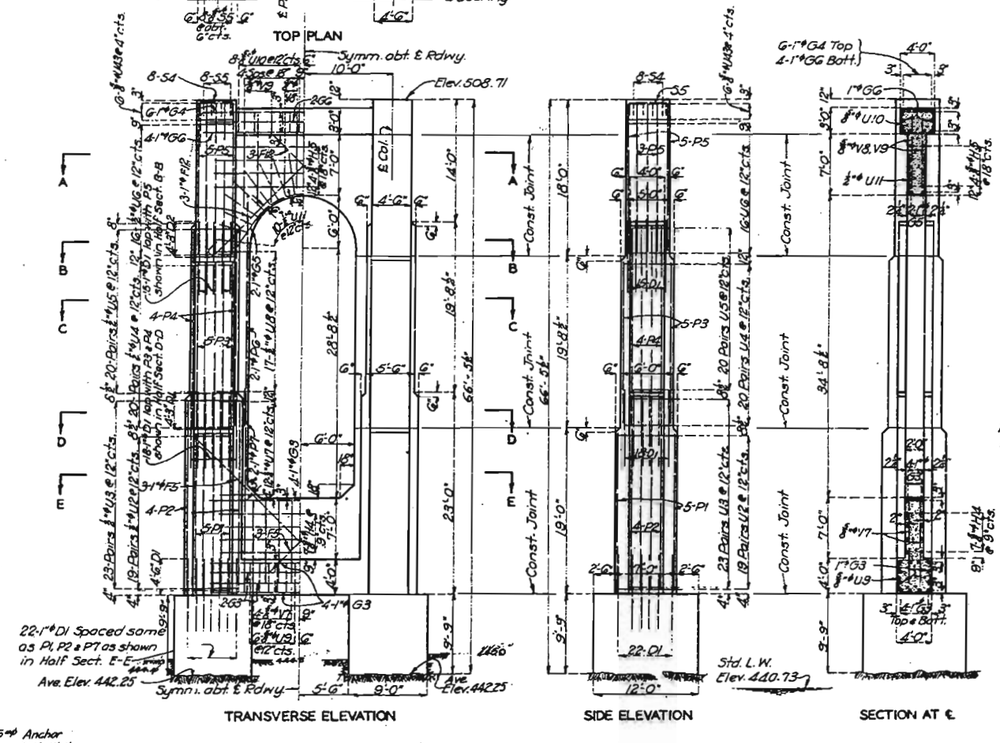
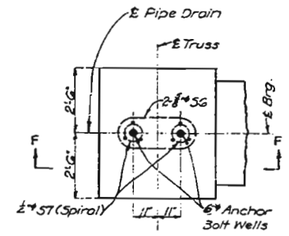
METALLIC EDGE MOULDING

Note: Cost of metallic edge moulding to be included in unit bid price for concrete.

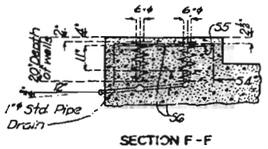






PART PLAN

Note: S4 and S5 bars not shown in plan.



SECTION F-F

Note: (Anchor bolt well, pipe drain)

1"ø Std. pipe drain, as shown and noted on these drawings, shall consist of one elbow, one tee, one pipe cap, and such lengths of 1"ø pipe as will be required to build. All pipe and fittings shall be galvanized.

These drains shall be so placed that their tops will be flush with the bottom of anchor bolt wells, and the protruding drainage end shall not be capped until after anchor bolts have been grouted in place.

The cost of forming wells, furnishing and placing pipe drains, shall be included in the price bid for other items of the substructure.

DETAILS OF PIER NO. 2

NOTES:

Footing for bent No. 1 shall be carried at least 6' into solid rock. Rock to be capable of carrying a foundation pressure of at least 4 ton per sq. ft.

Footing for pier No. 2 shall be carried at least 12' into solid rock. Rock to be capable of carrying a foundation pressure of at least 12 ton per sq. ft. Footings shall not be founded higher than Elevation 440.0.

Bent No. 1 and Pier No. 2 footings shall be placed in the dry.

All bridge seats under shoes are to be built to elevations given and finished in accordance with instructions on anchor bolt plan, see sheet No. 3.

For general substructure notes, see sheet No. 8.

ESTIMATED QUANTITIES	
Extra Concrete	23.3 C.Y.
Concrete omitted from Pier	12.0 C.Y.
Extra Reinforcing Steel	5,460 #.
Steel omitted from original Pier	1165 #.
5" Gas Pipe and Flanges	32'-0"
Steel Ladder	90 lbs/ft.
2½" ø Pipe	15'-0"

GENERAL NOTES:-
All concrete to be same class as that used in Pier.
Concrete and reinforcing steel, over that required in construction of Pier as shown on original plans, to be paid for by U.S.G.S.
Door and window, including fittings, ladders, steps, railing, hand grips, and other appurtenances to be furnished by U.S.G.S.
All inserts required shall be located by U.S.G.S. and placed prior to placing concrete in forms.
G1 and H6 Bars shown on original plans to be omitted.
Unless otherwise noted, General Substructure Notes given on Sheet No. 8 of Plans will control.

NOTES:

For general substructure notes, see sheet No. 8.

For note on 1" Std. Pipe Drain, see sheet No. 4.

All bridge seats under shoes are to be built to elevations given and finished in accordance with instructions on anchor bolt plan, see sheet No. 3.

Base of Pier No. 3 shall be placed in the dry.

Bases of Piers #3 & 4 shall be carried into solid rock. See Special Provisions. Rock to be capable of carrying a foundation pressure of at least 4 ton per sq. ft. on pier No. 3 and of at least 17 ton per sq. ft. on pier No. 4.

Bars S8 and S12 shall be so placed as to clear anchor bolt wells 1 inch.

In regard to Pier 4, Concrete in Base of Pier should be computed below Elev. 437. Concrete in Pier Shafts should be computed above Elev. 437. Where actual & correct dimensions are shown use the correct dimension for computing quantities.

All concrete in Pier Bases should be computed from bottom of C.E. to Elev. 432.0 regardless of dimensions given. All concrete in Pier Shafts should be computed above Elev. 432.0 regardless of dimensions given. Where both Correct & actual dimensions are given, use the Correct dimension for Computations.
Final position of Caissons are shown in Top Plan.

NOTES:

For general substructure notes, see sheet No. 8.
For notes on 1" ϕ Std. Pipe Drain, see sheet No. 4.
All bridge seats under shoes are to be built to elevations given and finished in accordance with instructions on anchor bolt plan, see sheet No. 3.
Bases of Piers #5 & 6 shall be carried into rock and keyed. See Special Provisions. Rock to be capable of carrying a foundation pressure of at least 17 ton per sq. ft. on Pier No. 5 and at least 21 ton per sq. ft. on Pier No. 6.
Bars S12 and S16 shall be so placed as to clear anchor bolt wells 1 inch.

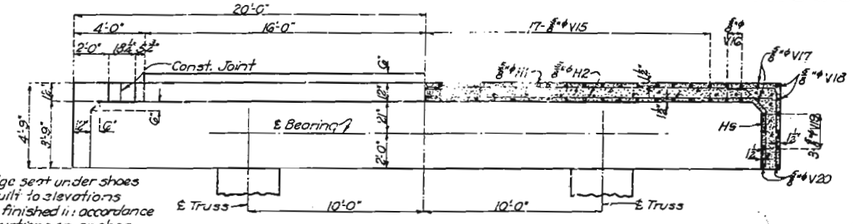
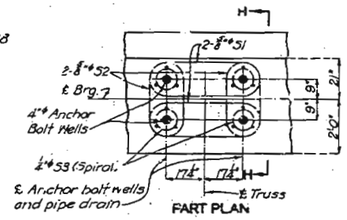
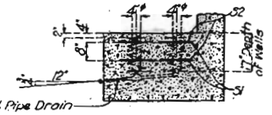
Docket #2981

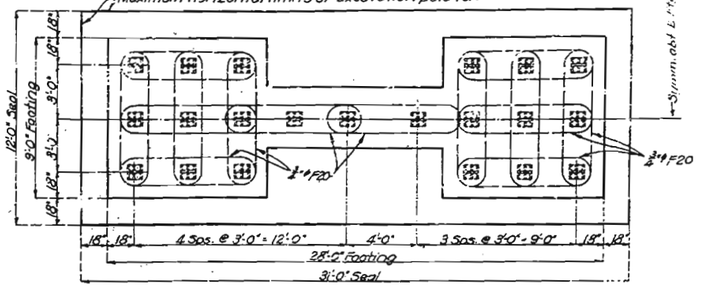


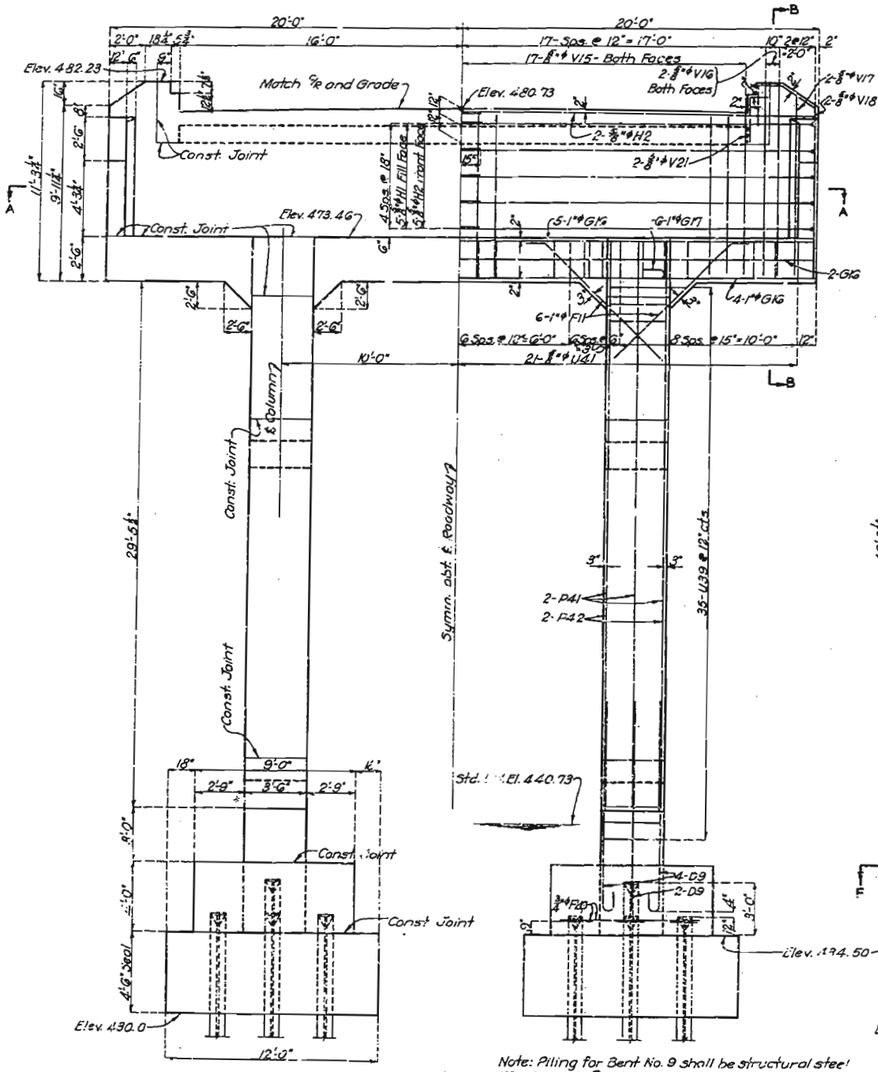
Note: Bridge seat under shoes shall be built to elevations given and finished in accordance with instructions on anchor bolt plan, see sheet No. 3.



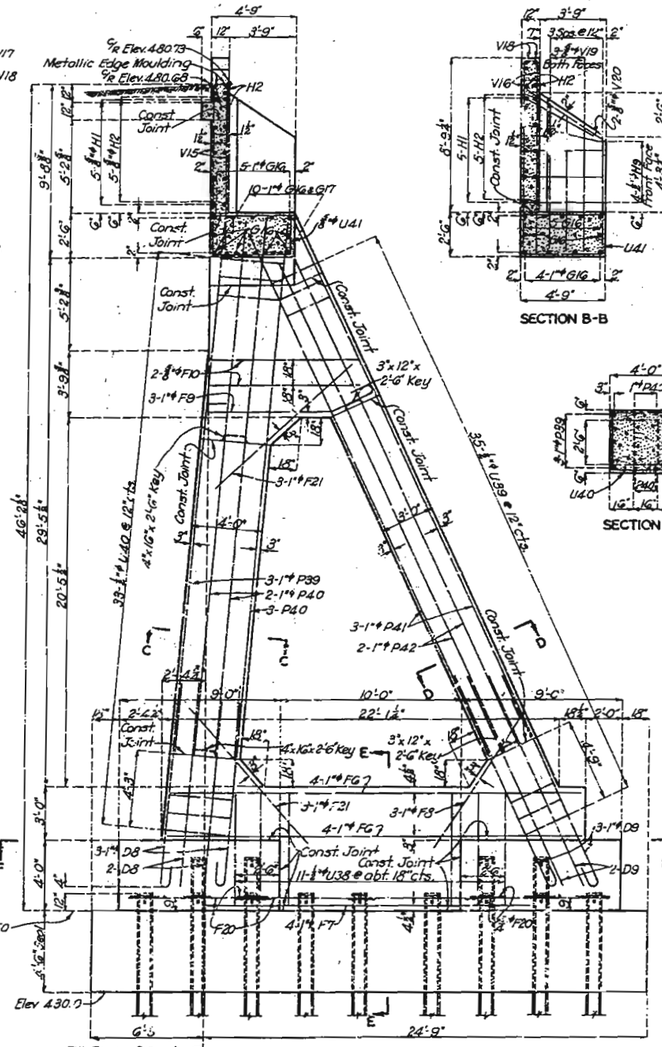


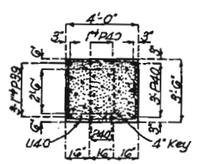
Note: For note on 1"ϕ Std. Pipe Drain, see Sheet No. 4.

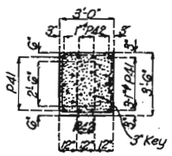


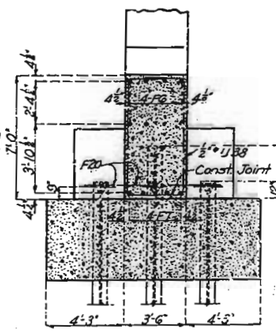


Note: Piling for Bent No. 9 shall be structural steel 10"WBm. @ 49# The pile shall be driven to rock.
No piling shall be ordered until authorized by the Engineer in writing.
Concrete in Bent No. 9 above Elev. 434.50 shall be placed in the dry.









GENERAL SUBSTRUCTURE NOTES:

All concrete in substructure shall be Class "B" concrete.

All exposed edges of bents No. 1 and 9 shall be beveled ¾" where no other bevel is noted. All exposed edges and all re-entrant corners of piers No. 2 to 8 inclusive shall be beveled 1½" where no other bevel is noted.

Provide substantial keys at all construction joints.

Lap splice all reinforcing bars 48 diameters except as otherwise shown.

Pier bases of piers No. 4, 5, 6, and 7 shall be constructed by the pneumatic caisson method, or by open dredging, but if open dredging is used, caissons must be arranged to land and seal under air. (See Special Provisions). For construction methods, materials, and details, see Special Provisions. Before starting construction the contractor shall submit to the Missouri State Highway Department, in triplicate, complete working drawings and a set of their design calculations for all caissons, cofferdams, and details in connection therewith and these drawings shall be returned with comments and suggestions.

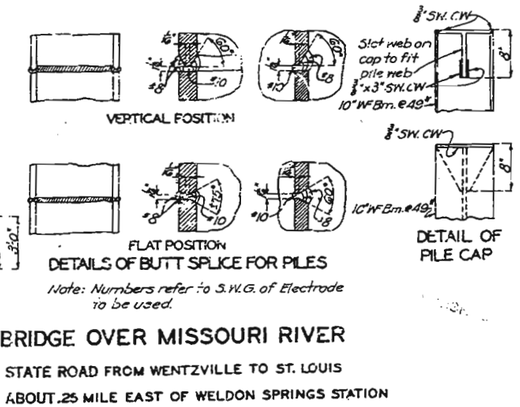
All cofferdam bracing which interferes with shafts or webs, is to be removed as the shafts or webs are concreted. No bracing shall be placed against any of the completed portions until they have attained sufficient strength.

All cofferdams shall be removed down to Elev. 437.0 before final acceptance of work.

All concrete above top of base in piers No. 4, 5, 6, and 7 and all concrete (except seal course) in piers No. 2, 3, and 8, and bents No. 1 and 9, shall be paid for at the price bid for concrete in shafts.

Estimated quantities for Class "B" concrete in seal course of pier No. 8 and bent No. 9 are based on dimensions given on plans. In case seal courses are omitted during construction by authority of the Engineer, the bottom of footings are to be built to Elev. 434.50 as shown on these design plans for footings proper.

Bridge excavation for Bents No. 1 and 9, and Piers No. 2, 3, and 8, shall be paid for in accordance with the Special Provisions. Cost of Bridge excavation for Piers No. 4, 5, 6, and 7, shall be included in the price bid for base concrete below Elev. 437.0.



Note: Numbers refer to S.W.G. of Electrode to be used.

ELASTIC CURVE FOR END REACTION

SUPERSTRUCTURE DESIGN DATA

SPECIFICATIONS:- Designed in accordance with the A.A.S.H.O. Conference Specifications for Structural Steel Highway Bridges of 1931, with exceptions as noted.

LOADING:- Railings; Use 150 lbs. per lin. ft. horizontal and 100 lbs. per lin. ft. vertical on rail, with 500 lbs. per lin. ft. horizontal at top of curb.

Dead load; as computed from detail drawings plus future wear of 25 lbs. per sq. ft. of roadway.

Live load; H-20, A.A.S.H.O., 1931; - 3 lanes control.

Transverse wind load in combination with Dead Load; Use a moving horizontal load of 30 lbs. per sq. ft. on the vertical projection of 2 trusses, 2 handrails and curbs, and one floor; but not less than 300 lbs. per lin. ft. on the loaded chord, and 150 lbs. per lin. ft. on the unloaded chord.

Transverse wind load in combination with Live Load; Use 50% of the Dead Load wind above, plus 100 lbs. per lin. ft. acting 6 foot above the roadway on the moving live load.

Longitudinal wind load; Use 50% of the specified transverse wind loads.

Longitudinal tractive force; Use 5% of the load on two lanes for the thru trusses and 10% of the load on two lanes for the deck trusses.

Thermal force; Use a rise in temperature of 60° F. and a drop of 80° F. from a normal of 60° F.

LOAD COMBINATIONS:- The following load combinations, at their appropriate unit stresses shall be used to proportion the structure and the proportioned structure shall satisfy any load combination.

At normal unit stress:-
DL + DL Wind.
DL + LL + I.

At 1.25 normal unit stress:-
DL + DL Wind + Temp.
DL + LL + I + LL Wind.
DL + LL + I + LL Wind + Traction.
DL + LL + I + LL Wind + Traction + Temp.

At 1.5 normal unit stress:-
Erection Loads

UNIT STRESSES:- Do not use overload provision of A.A.S.H.O., 1931, Specifications.

"A":- Axial tension.
"B":- Axial compression; on gross section of short lengths, or with lateral deflection prevented.
"C":- Axial compression; on columns.
"D":- Column formula. (L = column length in inches; r = least radius of gyration).
"E":- Bending, on extreme fiber; Tension on net section, or compression where $L/b < 15$.
"F":- Beam compression formula; (L = Unsupported flange length in inches, b = flange width in inches.)
"G":- Diagonal tension in webs of girders and rolled beams.
"H":- Shear; where girder webs have $h/t < 60$.
"I":- Shear formula, $h/t > 60$; (h = Clear distance between flanges or stiffeners. t = Thickness of web.)
"J":- Bearing; steel parts in contact. (d = diameter of rollers in inches.)

CLASSIFICATION	"A"	"B"	"C"	"D"	"E"	"F"	"G"	"H"	"I"	"J"
Carbon Steel	18,000	18,000	Max. 15,000	$\frac{18,000}{1+\frac{1}{18000}\left(\frac{L}{r}\right)^2}$	18,000	$\frac{20,000}{1+\frac{1}{2000}\left(\frac{L}{b}\right)^2}$	18,000	12,000	$\frac{18,000}{1+\frac{1}{7200}\left(\frac{h}{t}\right)^2}$	24,000
Silicon Steel	24,000	24,000	Max. 20,000	$\frac{24,000}{1+\frac{1}{18000}\left(\frac{L}{r}\right)^2}$	24,000	$\frac{27,000}{1+\frac{1}{2000}\left(\frac{L}{b}\right)^2}$	24,000	16,000	$\frac{24,000}{1+\frac{1}{7200}\left(\frac{h}{t}\right)^2}$	32,000
Cast Steel		18,000			13,500			10,000		24,000
Forged Carbon Steel					16,000					
Carbon Steel Pins					27,000			13,500		24,000
Power Driven Rivets	6500							12,500		25,000
Turned Bolts	12,000							12,000		24,000
Unfinished Machine Bolts	12,000							10,000		20,000
Rollers (Carbon or Cast Steel)										600d

Notes:- Above unit stresses are in lbs. per sq. inch; except for rollers which are in lbs. per lin. inch. Tension on bolts, on area at root of thread. Tension on rivets only where unavoidable. Turned bolts shall have not more than 1/64 inch driving clearance.

Bearing on masonry; Use 700 lbs. per sq. inch for normal conditions of bearing of shoes on concrete. Increase this to 900 lbs. per sq. inch allowable where excentricity (or moment) enters.

Special High Strength concrete in bridge floor slab; compression in flexure = 1200 lbs. per sq. inch, n = 10.

DETAIL FEATURES:- Distribution of wheel loads to slab; Use Westergaard's formula as modified and used in the Bureau of Public Roads study "Distribution of Wheel Loads and Design of Reinforced Concrete Bridge Floor Slabs," of July 1934.

Lacing; Design lacing for load equal to 2½% of the axial load of the member laced. Directly applied wind shears to be additive to this.

Girder Stiffeners; Space in accordance to the formula for allowable web shear, but not to exceed 6 ft., or the depth of the web.

GENERAL NOTES:- SUPERSTRUCTURE

All concrete shall be proportioned by weight proportioning method. See Special Provisions.

Two name plates, type "B" as shown on Std. S-918R, shall be furnished and placed by the superstructure contractor. Cost of name plates to be included in price bid for other items.

Trusses shall be fabricated to cambered truss dimensions. Laterals shall be fabricated to normal panel lengths, bolted during erection, and riveted up after the span is swung and the full dead load is in place.

No floor slab shall be placed until trusses are riveted and swung. Floor slab shall be placed starting from one end floorbeam and proceeding to the other, or starting from both ends and meeting at the center. Floor sections may be filled with concrete at any time after their attachment to the stringers, but each floor panel shall be completed in one continuous pour.

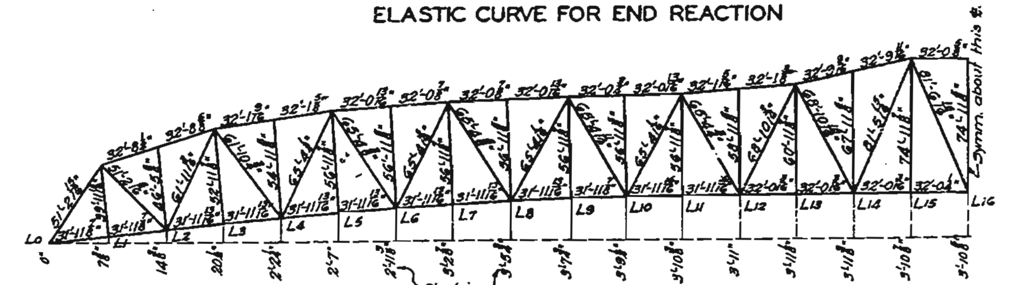
Before preparing shop drawings the contractor shall submit to the Missouri State Highway Department triplicate copies of his complete plans for erection method, erection loads, and erection stresses. These plans shall be subject to the approval of the Department. See Special Provisions.

Detail shop drawings for all structural and cast steel shall be submitted to the Missouri State Highway Department in duplicate, and shall be approved before steel is fabricated. Punching, reaming, drilling, and other shop requirements shall be in accordance with the Special Provisions. These requirements shall be clearly noted on the shop drawings to avoid oversight.

Paint:- Shop; none, except all machined surfaces one coat of white lead and tallow. Field; surfaces inaccessible after erection 3 coats of red lead; all other exposed surfaces three coats after erection and cleaning, first coat red lead, second and third coats aluminum. See Special Provisions.

For instructions on weighing reactions of the continuous span, and preservation of navigation. See Special Provisions.

Falsework for spans over existing railroad track shall be constructed to a minimum vertical clearance of 23'-0" and a minimum lateral clearance of 10'-0" from ℄ of tracks.



Note:- Dimensions given on this diagram include camber allowance. The truss is cambered for total dead load (including future wear) plus ½ (Live Load + Impact). The equivalent uniform live load (with the moment concentration replaced by an equivalent uniform load on the basis of 813' simple span) is used over the entire 1024 foot span. The trusses shall be fabricated to these dimensions and blocking.

ALTERNATE "B"

Notes:-

For general notes on superstructure see Sheet No. 9.

The bridge floor slab shall consist of one of the two alternate armored floor slab units as detailed. The depth of finished floor and the dimensions and weights of elements shall be as shown. All units of the slab shall be formed to the roadway crown in the shop. All form strips between the I-beams shall be placed in short lengths so as to extend only about 1" onto the edge of each support. Form strips shall be omitted over the flanges of floorbeams and end supports as shown on this and other plan sheets. See Special Provisions.

All steel used in the floor units shall be structural grade of A.S.T.M. Standard Specifications for Bridges A7-34 and shall be copper bearing. See Special Provisions.

After the units are erected and are welded to the supporting members they shall be filled with "Special Mix" Concrete, (See Special Provisions), vibrated in place, and finished flush with the tops of I-beams.

For further details of floor and end supports see Sheets No. 12.

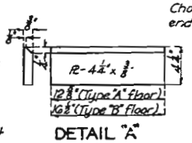
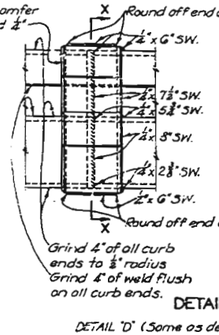
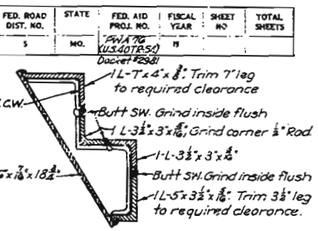
ELEVATIONS OF TYPICAL RAIL AND CURB DETAILS



DETAIL "A"

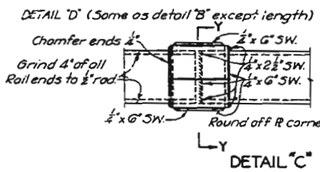


DETAIL "B"

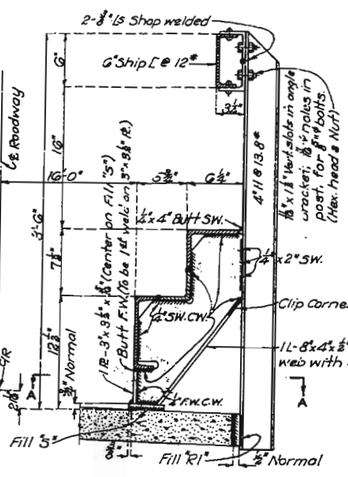


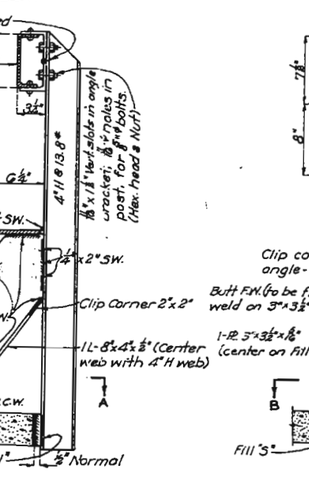
SECTION X-X

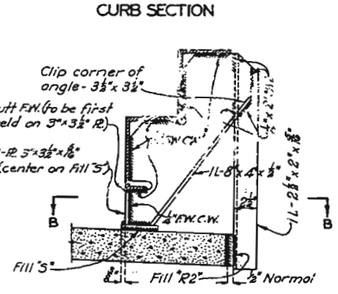
Note: All fabricated sleeves shall have not less than 1/8" or more than 3/8" clearance over rail or curb sections.

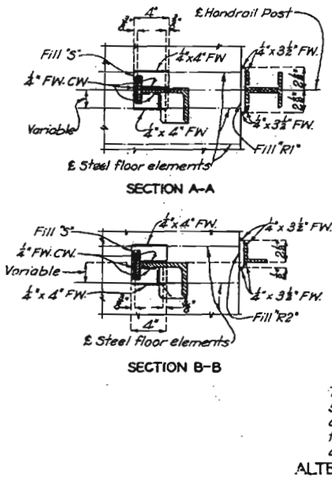


DETAIL "C"



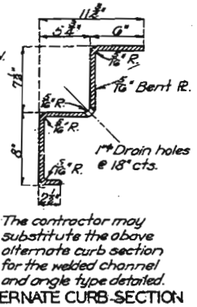




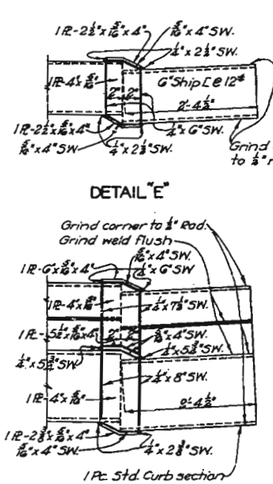


Fill	Size	Thickness Max	Thickness Min.	Type of Floor
R1	5"x 3 1/2"	3/4"	1/2"	"A" or "B"
R2	3"x 3 1/2"	3/4"	1/2"	"A" or "B"
S	4"x 4"	1"	1/2"	"A"
	4"x 5 1/2"	1"	1/2"	"B"

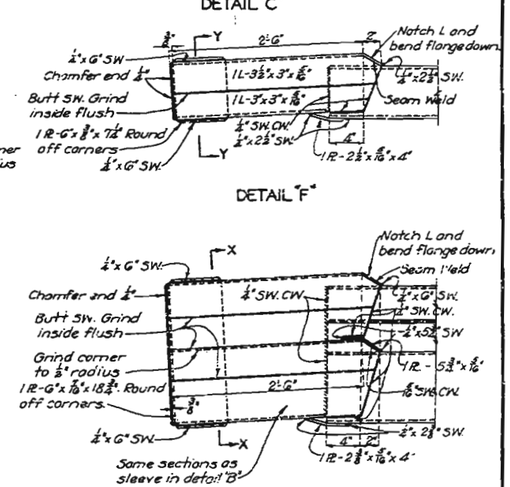
Note: These fills are to provide for alignment of handrail and curb. They shall be supplied in thicknesses varying by 1/8 inch between the limits given, and sufficient quantities of the various thicknesses shall be available at all times to insure proper alignment. Only one fill shall be used at any point. Payment shall be based on the required number at normal thickness.



The contractor may substitute the above alternate curb section for the welded channel and angle type detailed.
ALTERNATE CURB-SECTION



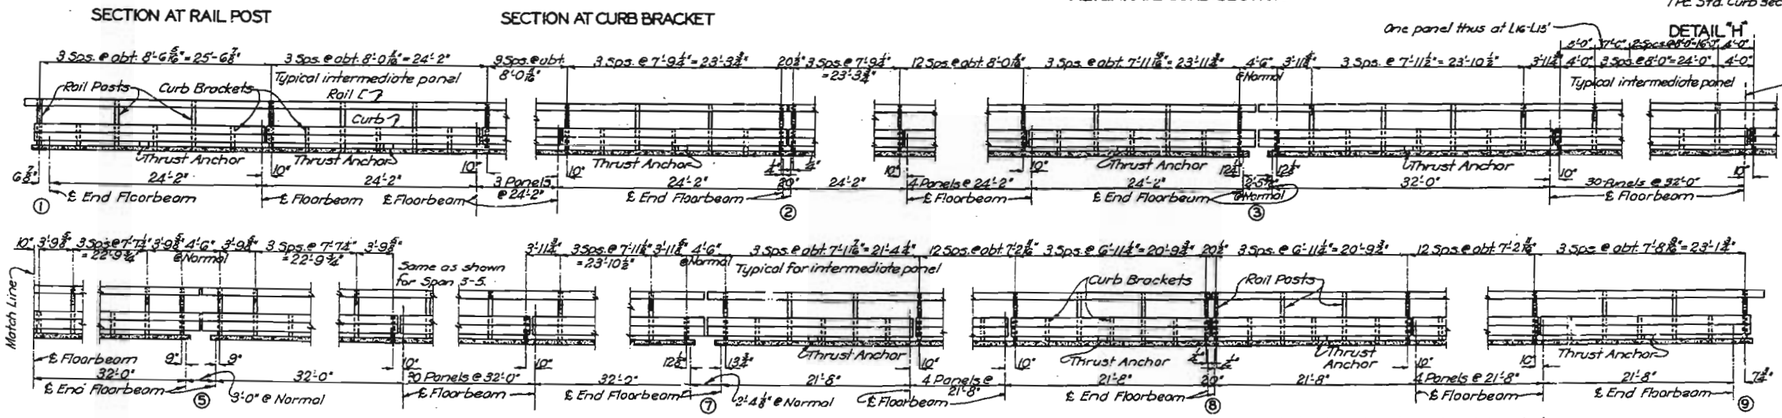
DETAIL "E"



DETAIL "F"

DETAIL "H"

DETAIL "K"



ELEVATION OF CURB AND HANDRAIL

Note: All rail posts and curb brackets normal to crown of roadway.
Curb brackets to be centered between rail posts.

NOTES:

For general notes on superstructure, see Sheet No. 9.

All structural steel shown on this sheet shall be copper bearing. See Special Provisions.

All welds shall be electric arc welds.

Handrail, curb, posts, and brackets shall be shop fabricated in units as shown, and these units shall be true to line and square. Units shall be erected, aligned, and securely clamped in place before making field welds.

Payment for material on this sheet will be based on the type of floor slab used, unless otherwise noted. If the alternate of a bent plate curb section is used, payment shall be based on the type used. Quantities are computed on the welded curb design.

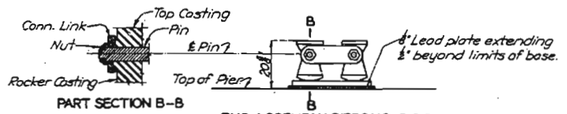
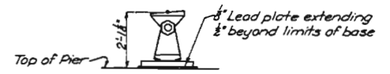
PART SECTION A–A

EXP. ASSEMBLY BENTS NO. 1 & 9

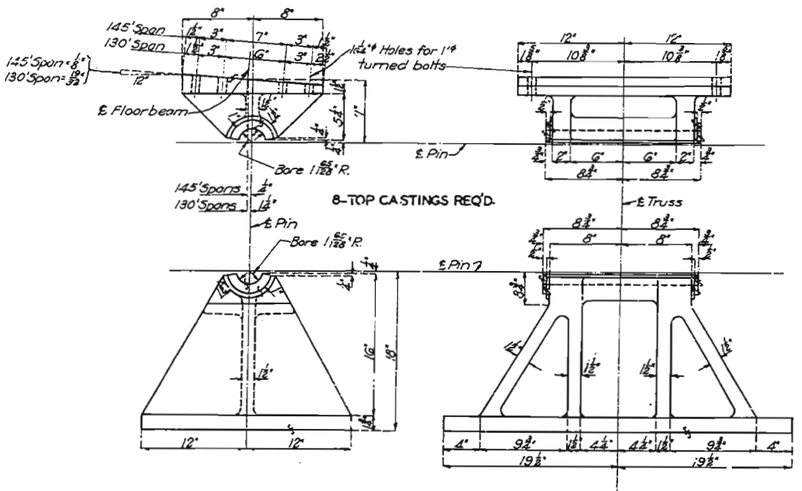


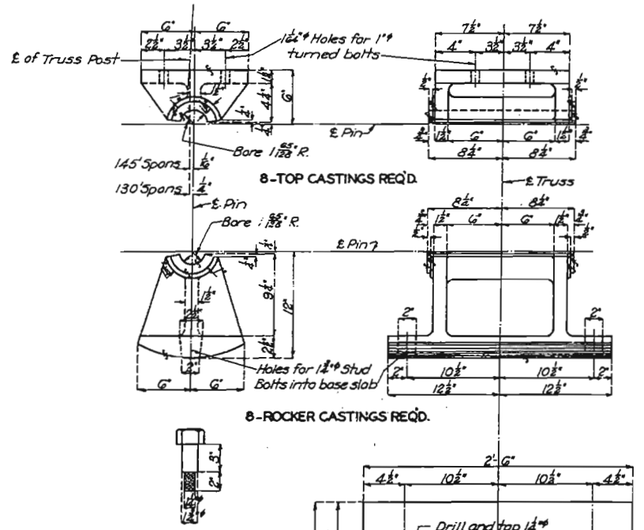
PART SECTION B–B

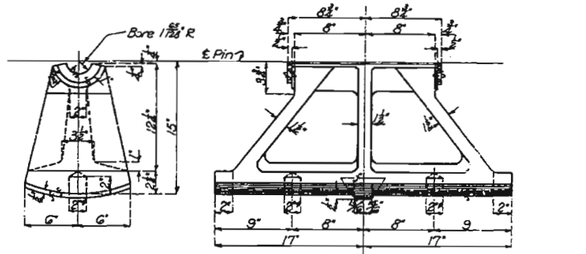
EXP. ASSEMBLY PIERS NO. 2 & 8

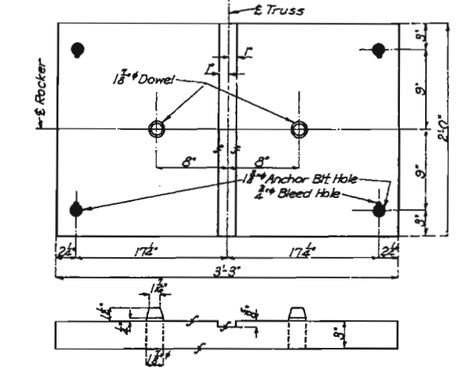


EXP. ASSEMBLY PIERS NO. 3 & 7

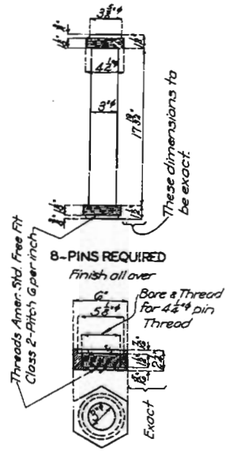


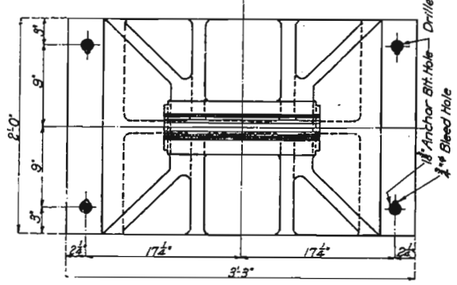






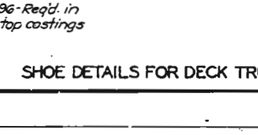
4–BASE SLABS REQ'D. (SINGLE ROCKER)





4–FIXED CASTINGS REQ'D.

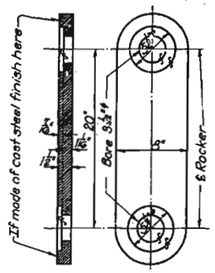
DETAIL OF BLEED HOLE



TURNED BOLTS (HEX.) NUTS

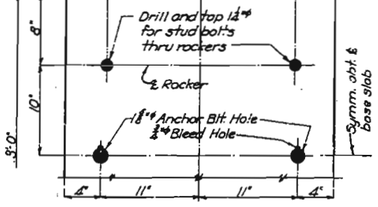
96–Req'd. in top castings

16–Req'd. in base slab.



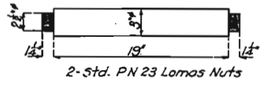
8–CONNECTING LINKS REQUIRED

Rolled or Cast Steel



4–BASE SLABS REQ'D. (DOUBLE ROCKER)

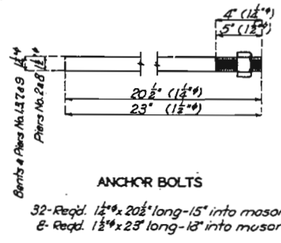
Slab 2'-6" x 3'-0" finish'd top and bottom to 22½" thickness.



2–Std. P.N 23 Lomas Nuts

8–PINS REQ'D.

Finish all over



ANCHOR BOLTS

32–Req'd. 1¼"ϕ x 20½" long–15" into masonry.
8–Req'd. 1⅛"ϕ x 23" long–18" into masonry.

NOTES:

For general notes on superstructure, see sheet No. 9.
For instructions for setting shoes, see sheet No. 3.
All fillets on castings to be ⅜" radius unless otherwise shown.
Grade of steel for castings and annealing to be in accordance with the Special Provisions.
Pins to be forged steel or cold rolled steel shafting.
All slabs and slab assemblies, pins, pin nuts, anchor and turned bolts with their nuts, shall be paid for as fabricated carbon steel in shoes.
All turned bolts are to be furnished with nuts and cut washers (¼" thick, bevel as req'd.)
The ⅛" lead plates shall be a single sheet covering the entire base area and extending ½" beyond the limits of the base. Cost of this lead plate shall be included in the price bid for other items.

BRIDGE OVER MISSOURI RIVER

STATE ROAD FROM WENTZVILLE TO ST. LOUIS

ABOUT .25 MILE EAST OF WELDON SPRINGS STATION

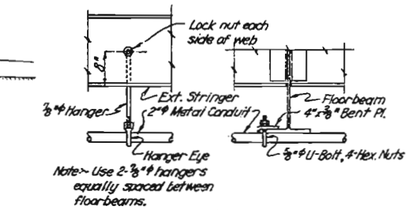
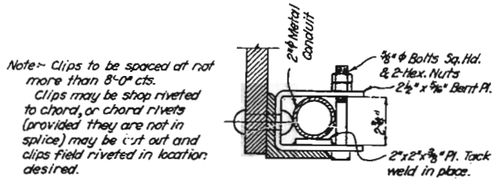
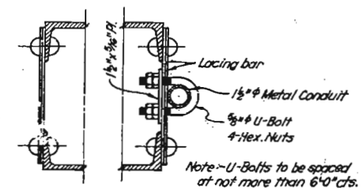
DIAGRAM SHOWING LOCATION OF NAVIGATION LIGHTS



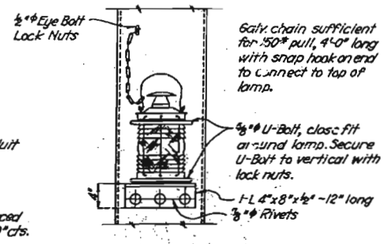
CONDUIT CONN. TO DECK TRUSSES



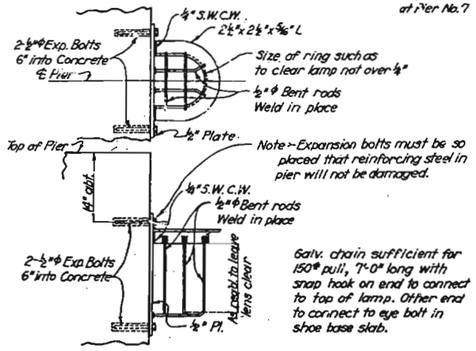
CONDUIT CONN. TO OUTSIDE OF BOTT. CHORD



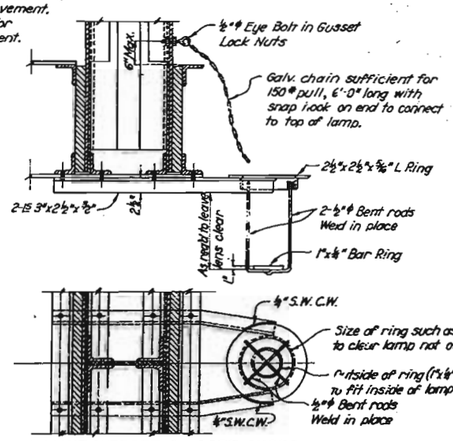
CONDUIT CONN. TO VERT. POSTS



WHITE LIGHT SUPPORT ON VERT. POSTS

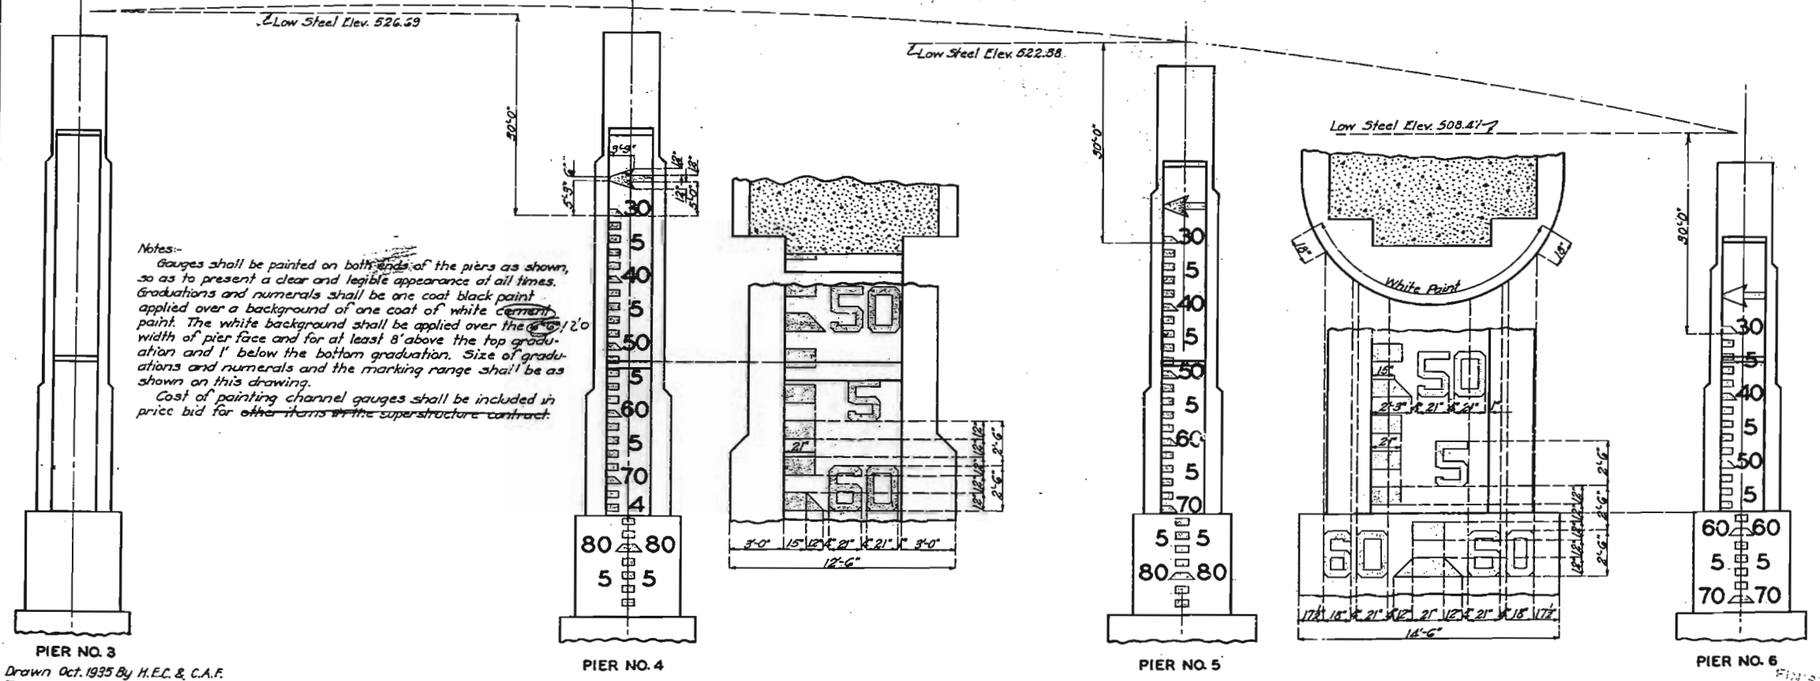


RED LIGHT SUPPORT ON PIERS



GREEN LIGHT SUPPORT ON BOTT. CHORD

DETAILS OF CONDUIT AND LIGHT SUPPORTS ON PIERS AND TRUSS MEMBERS



Notes:-
Gauges shall be painted on both ~~ends~~ of the piers as shown, so as to present a clear and legible appearance at all times. Graduations and numerals shall be one coat black paint applied over a background of one coat of white cement paint. The white background shall be applied over the entire 2'0 width of pier face and for at least 8' above the top graduation and 1' below the bottom graduation. Size of graduations and numerals and the marking range shall be as shown on this drawing.
Cost of painting channel gauges shall be included in price bid for ~~other items of the superstructure contract~~.

DETAILS OF CLEARANCE GAUGES

Notes:-
See Special Provisions regarding navigation lights, galvanized metal conduit, flexible galvanized metal conduit, pull boxes and junction boxes.

← See recomended erection proceedure to correct this overstress.

Members marked thus, * are tie plated tension members under erection compression.

NOTES ON STRESS ANALYSIS:

All loads and stresses are in kips. Stages of erection are as proposed by Kansas City Bridge Co.

Loads shown on trusses are for dead load of erected structure, plus 2 kips per panel for tram track (except 4 kips adjacent to traveler) plus traveler loads of 14 kips per axle.

Wind stresses are based on the specified 15 lb. per sq. foot wind and include horizontal truss action and overturn action.

Wind assumptions are as follows:-

Wind over entire structure, except Case I and Case IVa, in which cases partial or full loadings are used for maximum values.

Wind on traveler assumed at 3 kips per axle, acting 13.9 foot above ℄ bottom chord.

Top chord wind for Case I and Ia assumed transfered to bottom laterals by sways and portal.

Top chord wind from U1 to U15 assumed transfered to L0 and L16 by top laterals and portals for Cases II to IVa inclusive.

Top chord wind from U15' to U5' assumed transfered to bottom laterals by sways and portal.

When wind load reverses DL, 70% of DL is used to counteract wind.

CONCLUSIONS ON SUBMITTED ERECTION PROCEEDURE.

For DL + 15# Wind, L10L12 is stressed beyond the specified maximum compression under Case II. This member will meet the specified max. under 10# Wind, so we say OK. It is suggested that L16 be braced laterally to the pier as soon as possible in order to minumize wind stresses.

For DL + 15# Wind, L10L12 is stressed beyond the specified maximum tension under Cases IIa, IIIa, IV, and IVa. For DL only, L10L12 is stressed beyond the specified max. tension under Cases IIa and IV. A change in erection proceedure is necessary.

For DL + 15# Wind or for DL only, U5'L4' is stressed beyond the specified max. compression under Case IVa. A change in erection proceedure is required.

SUGGESTED ERECTION PROCEEDURE.

The overstress conditions can be corrected and a better stress condition obtained thruout truss for all Cases following Case II, by the following proceedure:-

Jacking loads at L16, case IIa, shall be limited to 225 tons, and at L10, case IIb, to 56 tons, these loads to be simultaineous. In other words, with L16 resting on shoe, there must remain a jacking reaction of 56 tons at the erection bent at L10. Care shall be taken to insure the above results. Erection bent shall remain in position at L10 until freed by the progress of erection from case IIb to case III.

Jacking load at L10' shall be limited to 50 tons. It is suggested that the erection bent at L10' be equiped with wedges so that it may be released from load without further jacking. No jacking will be permitted at this bent after the span is seated on the erection bent.

Jacking load at L4' shall not be less than 110 ton nor more than 155 ton. It is suggested that the lower limit be used if possible so as to reduce the erection load on the floorbeam connections.

Sheet 2 of 2 of these drawings give the erection stresses for DL + 15# wind for this suggested proceed[ure].

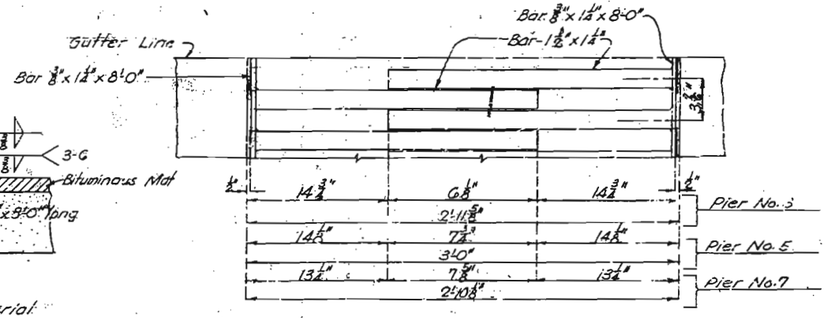
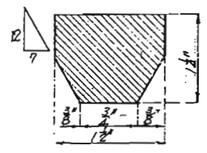
ROADWAY EXP. DEVICE AT PIERS NO. 3-5 &7

Pier No. 3 - Required 224-Bars ½"x12"x20", 8 Bars ⅜"x12"x8'0"
Pier No. 5 - Required 224-Bars ½"x12"x21", 8 Bars ⅜"x12"x8'0"
Pier No. 7 - Required 224-Bars ½"x12"x20", 8 Bars ⅜"x12"x8'0"

Total Weight = 7570#



PLAN



DETAIL "A"

GENERAL NOTES:

Material for steel bars shall comply with A.S.T.M. A 373 Specifications.

The steel bars shall be installed in sections to permit at least one way traffic at all times. Before traffic is permitted to cross over sections in place, sufficient bituminous surfacing shall be placed on roadway slab adjacent to both sides of expansion device to prevent any damage to either steel bars or tires of vehicles. All work and cost for his maintenance of traffic shall be at the expense of the contractor.

The contractor shall perform the welding in the following recommended procedure: Existing steel castings to be preheated to 300°F. All weld tacks to cast steel to be performed with a minimum of two passes. All welding shall be performed by qualified welders. The classification number of welding electrodes to be used shall be E-6015.

The number of 2"x⅜" bars listed for expansion device at each pier (3, 5 & 7) includes five additional bars and the weight of these bars is shown in the following table:

NOTE: ALL REINFORCEMENT IS INCLUDED IN SUPERSTRUCTURE QUANTITIES.

NOTE: ROCK REVETMENT AT BT. #1 AND #9 SHALL BE RESTORED AS SHOWN ON SHEET NO. 2 OF 22 OF ORIGINAL PLANS FOR BR. NO. J-1000. THE RESTORATION SHALL BE PAID FOR AS A ROADWAY ITEM.

GENERAL NOTES:

DESIGN SPECIFICATIONS: A.A.S.H.T.O.-1983 AND INTERIMS THRU 1988. LOAD FACTOR DESIGN

DESIGN LOADING: HS20-44 FLOOR SYSTEM, NO FUTURE WEARING SURFACE, EARTH 120#/CU.FT. EQUIVALENT FLUID PRESSURE 45#/CU.FT.

DESIGN UNIT STRESSES: CLASS B1 CONCRETE f'c= 4,000 psi
CLASS B1 SPECIAL CONC. SPEC. MIX (SUPERSTR. GRID FILL) f'c=4,000 psi
REINFORCING STEEL (GRADE 60) fy=60,000 psi
STRUCTURAL CARBON STEEL fy=36,000 psi
STRUCTURAL STEEL (A.S.T.M. A-572) GRADE 50 fy=50,000 psi
STRUCTURAL STEEL TUBING (TS) fy=46,000 psi

REINFORCING STEEL: MINIMUM CLEARANCE TO REINFORCING STEEL SHALL BE 1½", UNLESS OTHERWISE SHOWN.

FLOOR SYSTEM: STEEL GRID FLOOR (CONC. FILLED) (SEE SPECIAL PROVISIONS)

PAINTING: SYSTEM C(GREEN) BY CONTRACTOR IN ACCORDANCE WITH STD. SPEC. 712.12 AND SPECIAL PROVISIONS.

STRUCTURAL STEEL: STRUCTURAL STEEL TUBING (TS) FOR RAIL SHALL BE A-500-50 (GRADE B) ALL OTHER STRUCTURAL STEEL SHALL BE A-36 EXCEPT AS NOTED.

NAVIGATION AND CLEARANCE LIGHTS: ALL NAVIGATION AND CLEARANCE LIGHTING SHALL BE KEPT IN OPERATION DURING ALL CONSTRUCTION.

FIELD CONNECTION: FIELD CONNECTIONS, HIGH STRENGTH BOLTS ¾"Ø, HOLES 13/16"Ø, EXCEPT AS NOTED.

ALL MISSING OR DETERIORATED RIVETS SHALL BE REMOVED AND REPLACED WITH HIGH STRENGTH BOLTS.

BARS BONDED [illegible] CONCRETE NO. [illegible] ST[illegible] AND EMBEDDED INTO NEW CONCRETE WHERE POSSIBLE. IF LENGTH IS AVAILABLE, OLD BARS SHALL EXTEND INTO NEW CONCRETE AT LEAST 40 DIAMETERS FOR SMOOTH BARS AND 30 DIAMETERS FOR DEFORMED BARS.

LIGHT DOTTED LINES INDICATE OLD WORK. HEAVY LINES INDICATE NEW WORK. CONTRACTOR SHALL VERIFY ALL DIMENSIONS IN FIELD BEFORE ORDERING NEW STEEL.

PROFILE GRADE ELEVATIONS SHALL BE 1⅛" ABOVE EXISTING PROFILE GRADE.

PAYMENT FOR FURNISHING AND INSTALLING RESIN ANCHOR SYSTEMS SHALL BE FULLY COVERED BY THE CONTRACT UNIT PRICE FOR CONCRETE.

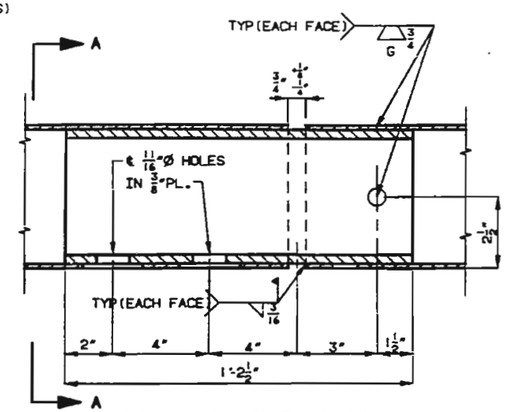
RAIL DETAILS AT EXP. JOINTS



DETAIL OF RAIL EXPANSION OR SPLICE JOINT

NOTE: FOR RAIL POST DETAILS NOT SHOWN SEE SHEET NO.24.

RAILING NOTES:

RAILING SHALL BE FABRICATED IN TWO OR THREE PANEL LENGTHS UNLESS OTHERWISE APPROVED.

CURBING SHALL BE PAINTED SYSTEM C (GREEN).

STRUCTURAL STEEL TUBE RAILING AND RAIL POST INCLUDING CONNECTING PLATES, BOLTS, NUTS, WASHERS AND ANGLES, SHALL BE GALVANIZED IN ACCORDANCE WITH ASTM A123 OR A153.

STRUCTURAL STEEL TUBE RAILING SHALL CONFORM TO REQUIREMENTS OF ASTM DESIGNATION A500 OR A501.

SPLICE IN RAILS SHALL BE PROVIDED AT ABOUT ¼ POINT BETWEEN POST. RAIL EXPANSION SPLICE SHOULD BE PROVIDED AT TRANSVERSE SEAL JOINTS.

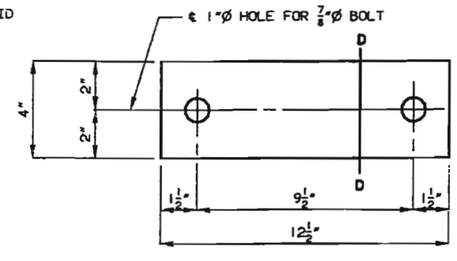
FABRICATION OF STRUCTURAL STEEL SHALL BE IN ACCORDANCE WITH SECTION 712 OF STANDARD SPECIFICATIONS.

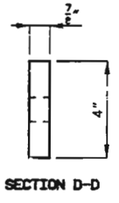
IF RAIL IS SHOP DRILLED USE 11/16"×1" HORIZONTAL SLOT IN TS 5"×5"×3/16" WITH 11/16"Ø HOLE IN RAIL POST FLANGE. USE 5/8"Ø BUTTON HEAD BOLTS (OVAL SHOULDER) WITH ONE FLAT WASHER AND HEX. NUT.

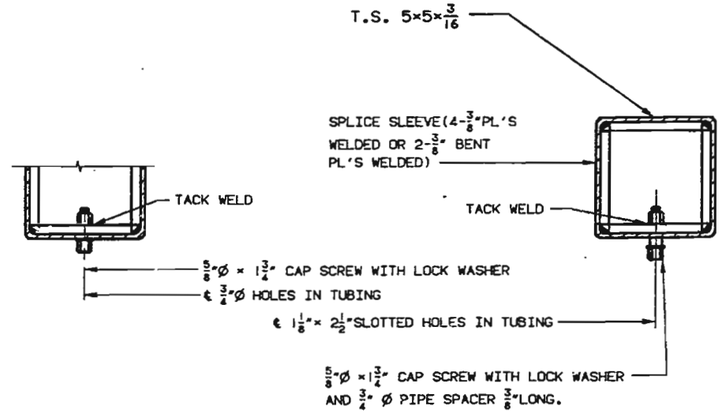
IF RAIL IS FIELD DRILLED USE 11/16"Ø HOLE IN TS 5"×5"×3/16" WITH 11/16"Ø HOLE IN RAIL POST FLANGE. USE 5/8"Ø BUTTON HEAD BOLT WITH ONE FLAT WASHER AND HEX. NUT.

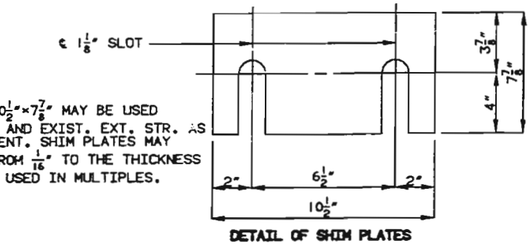
LOCATION OF SLOTS OR HOLES IS TO BE AT DIMENSIONS SHOWN REGARDLESS OF METHOD USED TO INSTALL PROPOSED RAILS.

5/8"Ø STUDS TO BE FASTENED TO TS 5"×5"×3/16" (SHOP OR FIELD APPLIED) MAY BE USED IN LIEU OF 5/8" BUTTON HEAD BOLTS. A 1" EXTRA HEAVY SPACER SHALL BE USED IN PLACE OF THE 3/4" EXTRA HEAVY SPACER IF 5/8"Ø STUDS ARE USED.









NOTE: SHIM PLATES 10½"×7⅞" MAY BE USED BETWEEN POST W8×24# AND EXIST. EXT. STR. AS REQUIRED FOR ALIGNMENT. SHIM PLATES MAY VARY IN THICKNESS FROM 1/16" TO THE THICKNESS REQUIRED AND MAY BE USED IN MULTIPLES.

NOTE: ROCK REVETMENT AT BT. #1 AND #9 SHALL BE RESTORED AS SHOWN ON SHEET NO. 2 OF 22 OF ORIGINAL PLANS FOR BR. NO. J-1000. THE RESTORATION SHALL BE PAID FOR AS A ROADWAY ITEM.

GENERAL NOTES:

DESIGN SPECIFICATIONS: A.A.S.H.T.O.-1983 AND INTERIMS THRU 1988. LOAD FACTOR DESIGN

DESIGN LOADING: HS20-44 FLOOR SYSTEM, NO FUTURE WEARING SURFACE, EARTH 120#/CU.FT. EQUIVALENT FLUID PRESSURE 45#/CU.FT.

DESIGN UNIT STRESSES: CLASS B1 CONCRETE f'c= 4,000 psi
CLASS B1 SPECIAL CONC. SPEC. MIX (SUPERSTR. GRID FILL) f'c=4,000 psi
REINFORCING STEEL (GRADE 60) fy=60,000 psi
STRUCTURAL CARBON STEEL fy=36,000 psi
STRUCTURAL STEEL (A.S.T.M. A-572) GRADE 50 fy=50,000 psi
STRUCTURAL STEEL TUBING (TS) fy=46,000 psi

REINFORCING STEEL: MINIMUM CLEARANCE TO REINFORCING STEEL SHALL BE 1½", UNLESS OTHERWISE SHOWN.

FLOOR SYSTEM: STEEL GRID FLOOR (CONC. FILLED) (SEE SPECIAL PROVISIONS)

PAINTING: SYSTEM C(GREEN)BY CONTRACTOR IN ACCORDANCE WITH STD. SPEC. 712.12 AND SPECIAL PROVISIONS.

STRUCTURAL STEEL: STRUCTURAL STEEL TUBING (TS) FOR RAIL SHALL BE A-500-501 (GRADE B) ALL OTHER STRUCTURAL STEEL SHALL BE A-36 EXCEPT AS NOTED.

NAVIGATION AND CLEARANCE LIGHTS: ALL NAVIGATION AND CLEARANCE LIGHTING SHALL BE KEPT IN OPERATION DURING ALL CONSTRUCTION.

FIELD CONNECTION: FIELD CONNECTIONS, HIGH STRENGTH BOLTS ¾"Ø, HOLES 13/16"Ø, EXCEPT AS NOTED.

ALL MISSING OR DETERIORATED RIVETS SHALL BE REMOVED AND REPLACED WITH HIGH STRENGTH BOLTS.
BARS BONDED IN OLD CONCRETE NOT REMOVED SHALL BE CLEANLY STRIPPED AND EMBEDDED INTO NEW CONCRETE WHERE POSSIBLE. IF LENGTH IS AVAILABLE, OLD BARS SHALL EXTEND INTO NEW CONCRETE AT LEAST 40 DIAMETERS FOR SMOOTH BARS AND 30 DIAMETERS FOR DEFORMED BARS.

LIGHT DOTTED LINES INDICATE OLD WORK. HEAVY LINES INDICATE NEW WORK. CONTRACTOR SHALL VERIFY ALL DIMENSIONS IN FIELD BEFORE ORDERING NEW STEEL.

PROFILE GRADE ELEVATIONS SHALL BE 1⅛" ABOVE EXISTING PROFILE GRADE.

PAYMENT FOR FURNISHING AND INSTALLING RESIN ANCHOR SYSTEMS SHALL BE FULLY COVERED BY THE CONTRACT UNIT PRICE FOR CONCRETE.

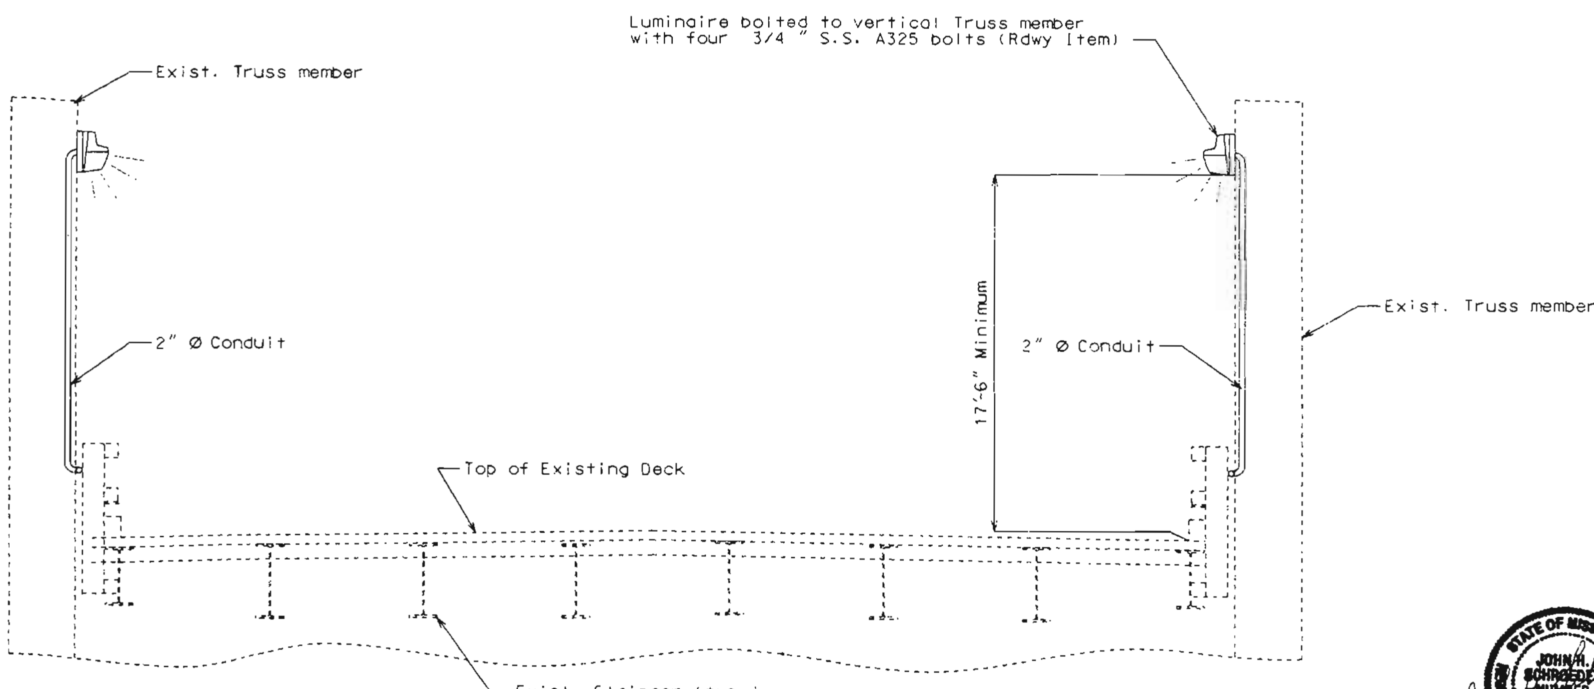
PLAN PLACEMENT OF LUMINAIRES

✱ Luminaire on vertical truss member

ESTIMATED QUANTITIES				
ITEM		SUBSTR.	SUPERSTR.	TOTAL
Conduit System on Structure	lump sum			1



TYPICAL SECTION THRU TRUSS
SPAN (3-4),(4-5),(5-6) & (6-&7)

General Notes:

All conduit shall be 2"Ø flexible metallic conduit secured to the rail posts and to the truss verticals at about 5'-0" cts.

Weepholes shall be provided at appropriate locations to drain any moisture in the conduit,system.

Expansion fittings shall be installed on conduit lines at each slab expansion device.

Expansion fittings shall provide a minimum movement in either direction of 9" at Piers 3 and 9 and 11 1/2" at Pier 5.

Junction boxes shall be placed as required. The terminations and covers shall be of watertight construction.

Payment for furnishing and installing Conduit System complete in place, will be paid for at the contract unit price for Conduit System on Structure. lump sum.

Traffic over structure to be maintained during construction. (See roadway plans for traffic control).

Outline of old work is indicated by dashed lines. Heavy lines indicate new work.

Cost of furnishing and placing anchor bolts for light standard shall be included in the contract unit price for other items.

Light standards, wiring and fixtures shall be furnished and installed by others.

For details of light standards, and wiring, see electrical plans.

ESTIMATED QUANTITIES

ITEM		SUBSTR.	SUPERSTR.	TOTAL
Fabricated Sign Support Brackets	lump sum			1

GENERAL NOTES:

Center and level signs.

All pipe, end caps, bolts, nuts and washers shall be galvanized.

All structural steel shall be ASTM A709 Grade 36, galvanized.

The cost of furnishing and erecting the new sign supports, complete-in-place, shall be paid for as "Fabricated Sign Support Brackets" per lump sum.

Outline of old work is indicated by light dashed lines. Heavy lines indicate new work.

The contractor shall verify all dimensions in field before ordering new steel.

Shift sign support brackets to minimum extent necessary to allow for clearence to existing gusset plates.

Cost of 4"Ø (nominal) Pipe ASTM A53 Grade B (schedule 40), including end caps per details from Mo. Std. Plan 903.10 and attachment, approved by the Engineer, to be included in bid price above.

12" extruded panels for signs shall be full length (29').

Proposed Signals and wiring shall be furnished and installed by others.

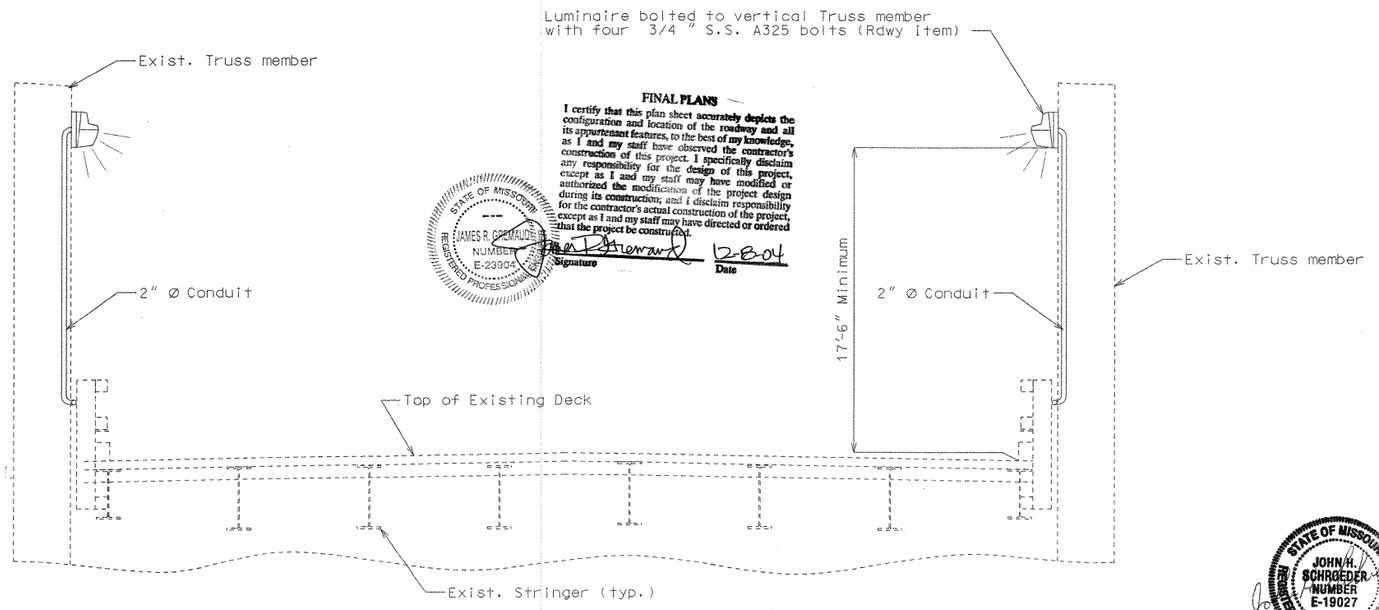
PLAN PLACEMENT OF LUMINAIRES

✳ Luminaire on vertical truss member

ESTIMATED QUANTITIES			
ITEM	SUBSTR.	SUPERSTR.	TOTAL
Conduit System on Structure lump sum			1



FINAL PLANS
I certify that this plan sheet accurately depicts the configuration and location of the roadway and all its appurtenant features, to the best of my knowledge, as I and my staff have observed the contractor's construction of this project. I specifically disclaim any responsibility for the design of this project, except as I and my staff may have modified or authorized the modification of the project design during its construction; and I disclaim responsibility for the contractor's actual construction of the project, except as I and my staff may have directed or ordered that the project be constructed.

SPAN (3-4),(4-5),(5-6) & (6-&7)

STATE OF MISSOURI — JOHN H. SCHROEDER — NUMBER E-19027 — REGISTERED PROFESSIONAL ENGINEER
DATE 9/13/00

General Notes:

All conduit shall be 2"Ø flexible metallic conduit secured to the rail posts and to the truss verticals at about 5'-0" cts.

Weepholes shall be provided at appropriate locations to drain any moisture in the conduit system.

Expansion fittings shall be installed on conduit lines at each slab expansion device.

Expansion fittings shall provide a minimum movement in either direction of 9" at Piers 3 and 9 and 11 1/2" at Pier 5.

Junction boxes shall be placed as required. The terminations and covers shall be of watertight construction.

Payment for furnishing and installing Conduit System complete in place, will be paid for at the contract unit price for Conduit System on Structure, lump sum.

Traffic over structure to be maintained during construction. (See roadway plans for traffic control).

Outline of old work is indicated by dashed lines. Heavy lines indicate new work.

Cost of furnishing and placing anchor bolts for light standard shall be included in the contract unit price for other items.

Light standards, wiring and fixtures shall be furnished and installed by others.

For details of light standards, and wiring, see electrical plans.

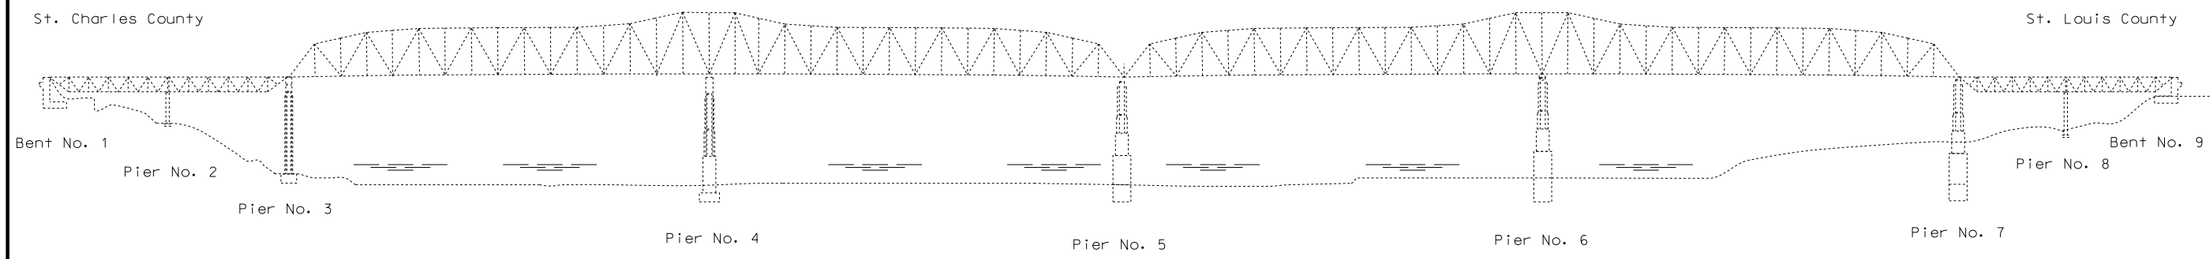
SEC/SUR 34 TWP 46N RGE 3E



GENERAL ELEVATION

General Notes:

Design Specifications:

2002 - AASHTO 17th Edition
Load Factor Design
Seismic Performance Category A
Bridge Deck Rating = 7

Design Loading:

H20 (1931); HS20-44 (1989) (Grid Deck only)
No Future Wearing Surface

Design Unit Stresses:

Structural Steel (ASTM A709 Grade 50) fy = 50,000 psi

Verify Dimensions:

Contractor shall verify all dimensions in field before ordering new material.

Traffic Control:

Maintain one to two lanes of traffic on structure limited to nightime construction except for allowed weekend closures.
See roadway plans & roadway job special provisions for traffic control during construction.

Fabricated Steel Connections:

Field connections shall be made with 3/4" diameter high strength bolts and 13/16" diameter holes, except as noted or where 7/8"Ø rivets are being replaced.

High strength bolts, nuts and washers will be sampled for quality assurance as specified in Sec 106 and Field Section (FS-712) from Materials Manual.

Structural Steel Repairs:

Fabricated structural steel shall be ASTM A709 Grade 50, except as noted.

All new steel shall be subject to notch toughness requirements.

A water resistant, durable, seal material shall be provided at all ends of repair plates and angles with gaps between new and existing structural steel. All required structural steel coating shall be applied prior to the installation of the seal material.

Concrete Protective Coatings:

Protective coating for concrete bents and piers (Urethane) shall be applied as shown on the bridge plans and in accordance with Sec 711.

Rivets:

All missing or deteriorated rivets shall be removed and replaced with high strength bolts. Rivets along the outside row of rivets at gusset plates with excessive pack rust shall be removed and replaced with high strength bolts, per the engineer's direction. The cost of furnishing and installing these high strength bolts will be considered completely covered by the contract unit price for Rivet Removal and Replacement, except as noted (See Special Provisions).

Miscellaneous:

Outline of old work is indicated by light dashed lines. Heavy lines indicate new work.

"Sec" refers to the sections in the standard and supplemental specifications unless specified otherwise.

For Structural Steel Protective Coating notes, see Sheet No. 3.

Contractor shall verify all dimensions in field before ordering new material.

Estimated Quantities

Item		Total
Removal of Existing Bar Dams & Adjacent Wearing Surface	linear foot	96
Substructure Repair (Formed)	sq. foot	375
Protective Coating - Concrete Bents and Piers (Urethane)	lump sum	1
Cleaning and Coating Bearing	each	26
Rehabilitate Bearing	each	2
Bearing Seat Repair	each	3

SPAN (8-9)

Notes:

The contractor shall stencil in black paint all the trusses panel points, except the end panels, on the east and west sides. The capital letters and number shall be approximately 3 inches in height. The corresponding upper panel point number for the deck trusses shall be stenciled on the outside face of vertical members except the L1 & L1′ shall be stenciled on the outside face of one of the diagonal member(s). The corresponding lower panel point number for the thru trusses shall be stenciled on the roadway face of the vertical member at a location 5 feet above the top of the deck. Also the even panel point numbers shall be stenciled on the outside gusset face of the east and west sides.

□ Panel points to be repaired. (Work with Sheets No. 6 thru 11).

○ Panel points to be recoated. (work with Sheet No. 3).

Some of the panel points in the field are mislabeled. The panel points shown on this sheet shall be used.

PART ELEVATION AT L4 & L6
SHOWING COATING LIMITS
(3 LOCATIONS)(DECK TRUSS)

Note: Coat panel point at L4 W. in Span (2-3) and L6 E. & W. in Span (2-3).

Structural Steel Protective Coatings:

Protective Coating: System H in accordance with Sec 1081.

Coating Limits:

Coating limit at each panel point shall include all structural steel within the panel point to a limit of 6 inches beyond all connection plates, vertical and horizontal, at the panel point. Within coating limits shown all existing & new steel shall be coated with complete System H. Within this limit, items to be coated shall include all beams, plates, channels, angles, rivets, bolts and miscellaneous structural steel items. New finish field coat shall overlap existing coating by a minimum of 6 inches.

Surface Preparation: Surface preparation of all existing steel within the defined coating limits shall be in accordance with Sec 1081 for "Recoating of Structural Steel (System G or H)". The cost of surface preparation will be considered completely covered by the contract unit price per each for "Recoating Gusset Plates (System H)".

Prime Coat of Existing Steel: The cost of the prime coat will be considered completely covered by the contract unit price per each for "Recoating Gusset Plates (System H)". Tint of the prime coat for System H shall be similar to the color of the field coat to be used.

Prime Coat of New Steel: The cost of the prime coat will be considered included with the new steel being supplied for the repairs. Tint of the prime coat for System H shall be similar to the color of the field coat to be used.

Field Coat: The color of the finish field coat shall be Green (Federal Standard #24260). The cost of the intermediate field coat will be considered completely covered by the contract unit price per each for "Recoating Gusset Plates (System H)". The cost of the finish field coat will be considered completely covered by the contract unit price per each for "Recoating Gusset Plates (System H)".

Bearings:

Bearings shall be cleaned and coated with System H. (See Special Provisions)

Each panel point will be considered 1 location. E & W will be considered separate locations.

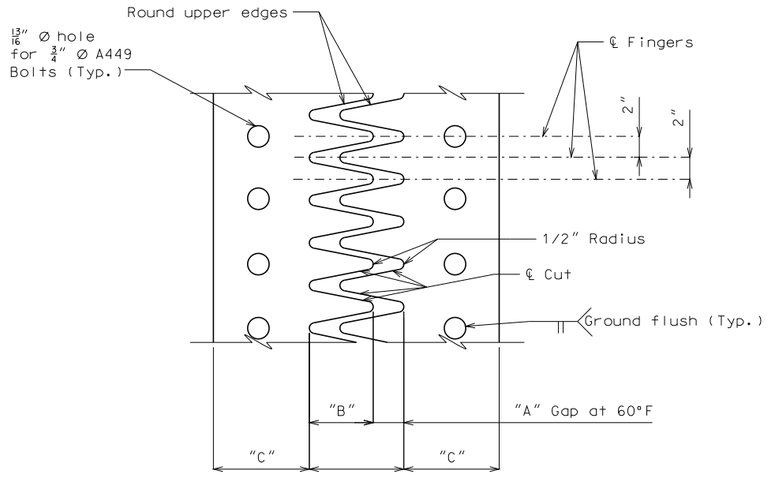
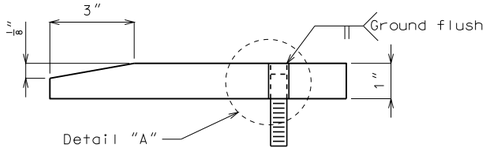
PART SECTION THRU EXPANSION DEVICE SHOWING REMOVAL

Note: Payment for removal and disposal of existing channel, angle and wearing surface will be considered completely covered by the contract unit price for Removal of Existing Bar Dams and Adjacent Wearing Surface.

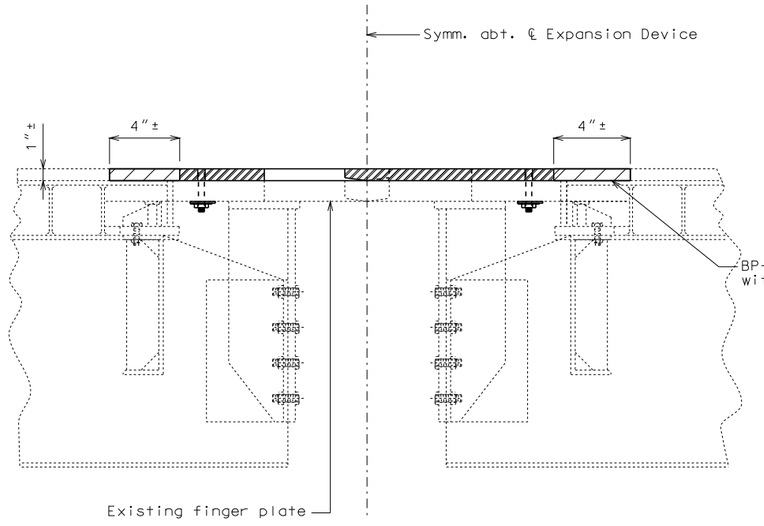
Removal of Existing Bar Dams and Adjacent Wearing Surface will be measured to the nearest linear foot from roadway face of curb to roadway face of curb along the centerline of existing joint for each joint.



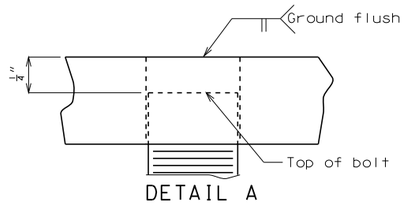
TYPICAL PLAN OF PLATE



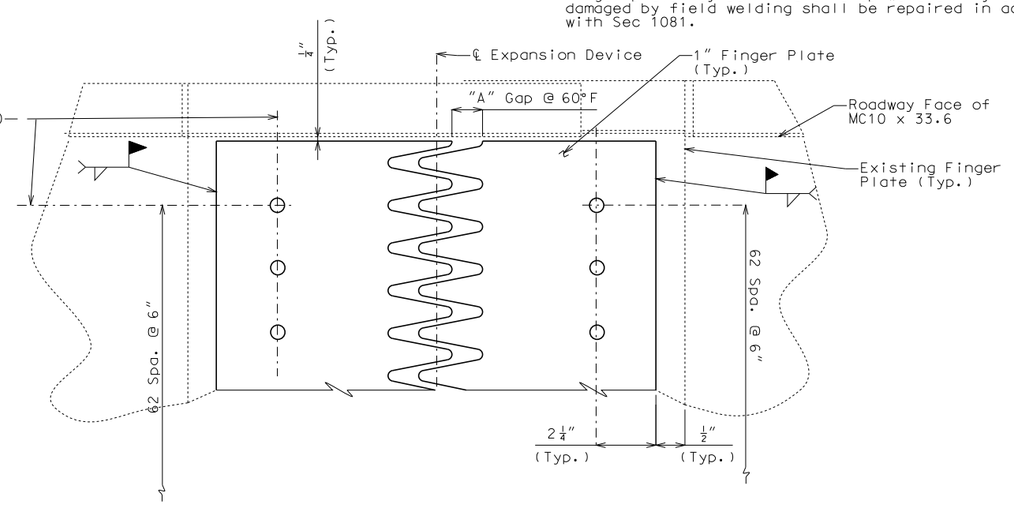
FINGER DETAIL



PART SECTION SHOWING MODIFIED FINGER PLATE TO BE INSTALLED



DETAIL A



PART PLAN OF MODIFIED FINGER PLATE EXPANSION DEVICE

Note: Asphaltic concrete not shown for clarity.

GENERAL NOTES:

New fingers of the modified finger plate shall align & match the the old fingers outline.

Modified finger plate shall be cut with a machine guided gas torch from one plate. The plate from which fingers are cut may be spliced before fingers are cut. The surface of cut shall be perpendicular to the surface of the plate. The cut shall not exceed 1/8" in width. The centerline of cut shall not deviate more than 1/16" from the position of centerline of cut shown.

Plan dimensions are based on installation at 60°F. The expansion gap and other dimensions shall be increased or decreased "D" for each 10° fall or rise in temperature at installation.

Materials for the expansion device shall be ASTM A709 Grade 50 structural steel.

Structural steel for the expansion device shall be coated with a minimum of two coats of inorganic zinc primer (5 mils minimum) or galvanized in accordance with ASTM A123.

The cost of furnishing all materials, coating or galvanizing, equipment and labor necessary for Modified Finger Plate, complete-in-place, will be considered completely covered by contract unit price for Modified Finger Plate per linear foot.

Modified Finger Plate Expansion device shall be fabricated for staged construction. A partial joint penetration groove weld splice shall be required. Welds shall be ground flush to provide a smooth surface. The expansion device shall be fabricated and installed to the crown and grade of the roadway. See Sec 1081.6 for repairing galvanized metal.

Penetration welds shall be nondestructively tested by an approved method.

Asphaltic concrete shall be in accordance with Sec 403.

The cost of furnishing and installing all materials including tack coat and asphaltic concrete adjacent to Modified Finger Plate will be considered completely covered by the contract unit price for Modified Finger Plate per linear foot.

Welding of bolts to finger plate shall be sequenced such that the surface temperature of the steel adjacent to the hole to be welded has cooled to 125°F.

At the contractor's option, welding of the bolts to the finger plate may be field or shop welded. Any coating damaged by field welding shall be repaired in accordance with Sec 1081.

✳ Match existing gap

DETAIL OF 3/8" PLATE SHOWING DIMENSIONS LOCATED IN SPAN (7-8)

Note:

Removing existing plates, bolts and rivets and furnishing and installing new plates and bolts for replacing gusset plates will be considered completely covered by the contract unit price for Replace Existing Gusset Plates.

Field drill 15/16"Ø holes in new plates (match existing locations) and use 7/8"Ø H.S. bolts to attach to existing truss members.

See Special Provisions for Rivet Replacement except that cost of work will be considered completely covered by the contract unit price for Replace Existing Gusset Plates.

Each location will be considered one repair. E and W, int. & ext. will be considered separate locations.

Job No. J6P1977, St. Louis/St.Charles County
June 2010 Letting

Please find attached six sets of half-sized prints for bridge sheet no's. 4 & 6 for the above referenced structure.

This change order is for field conditions that were different than planned. Sheet 4 was revised to show 1/8" lead plate, rubber or fabric pads under the new bearing plate instead of mortar. Sheet 6 was revised due to bulging of the existing splice plate that required filler plates to bridge the bulging splice plate. Also middle splice plate repair was added at the bulging splice plate locations.

Attachments

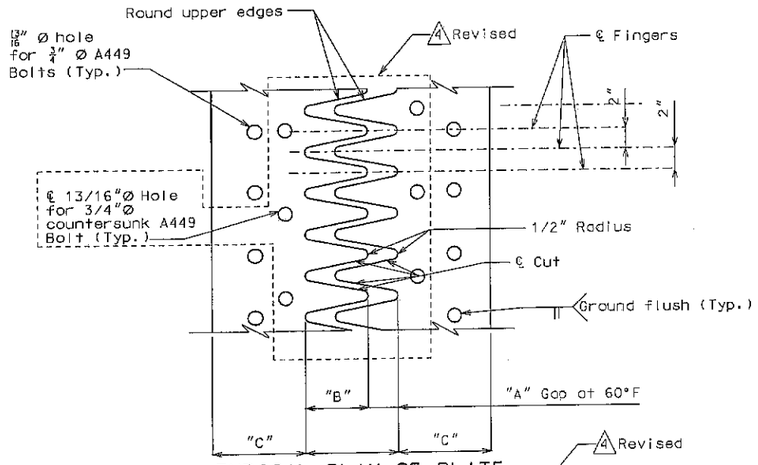
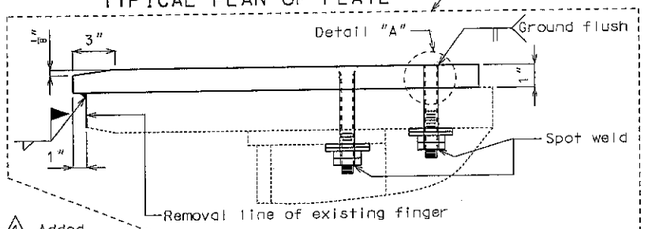
PART SECTION THRU EXPANSION DEVICE SHOWING REMOVAL

Note: Payment for removal and disposal of existing channel, angle and wearing surface will be considered completely covered by the contract unit price for Removal of Existing Bar Dams and Adjacent Wearing Surface.

Removal of Existing Bar Dams and Adjacent Wearing Surface will be measured to the nearest linear foot from roadway face of curb to roadway face of curb along the centerline of existing joint for each joint.



TYPICAL PLAN OF PLATE



FINGER DETAIL

GENERAL NOTES:

New fingers of the modified finger plate shall align & match the the old fingers outline.

Modified finger plate shall be cut with a machine guided gas torch from one plate. The plate from which fingers are cut may be spliced before fingers are cut. The surface of cut shall be perpendicular to the surface of the plate. The cut shall not exceed ¼" in width. The centerline of cut shall not deviate more than 1/16" from the position of centerline of cut shown.

Plan dimensions are based on installation at 60°F. The expansion gap and other dimensions shall be increased or decreased "D" for each 10° fall or rise in temperature at installation.

Materials for the expansion device shall be ASTM A709 Grade 50 structural steel.

Structural steel for the expansion device shall be coated with a minimum of two coats of inorganic zinc primer (5 mils minimum) or galvanized in accordance with ASTM A123.

The cost of furnishing all materials, coating or galvanizing, equipment and labor necessary for Modified Finger Plate, complete-in-place, will be considered completely covered by contract unit price for Modified Finger Plate per linear foot.

Modified Finger Plate Expansion device shall be fabricated for staged construction. A partial joint penetration groove weld splice shall be required. Welds shall be ground flush to provide a smooth surface. The expansion device shall be fabricated and installed to the crown and grade of the roadway. See Sec 1081.6 for repairing galvanized metal.

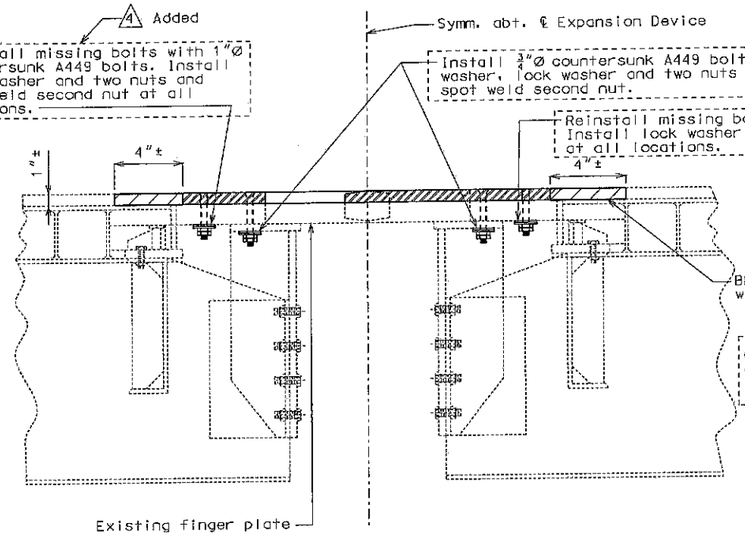
Penetration welds shall be nondestructively tested by an approved method.

Asphaltic concrete shall be in accordance with Sec 403.

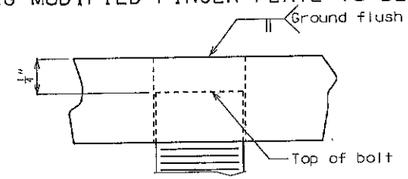
The cost of furnishing and installing all materials including tack coat and asphaltic concrete adjacent to Modified Finger Plate will be considered completely covered by the contract unit price for Modified Finger Plate per linear foot.

Welding of bolts to finger plate shall be sequenced such that the surface temperature of the steel adjacent to the hole to be welded has cooled to 125°F.

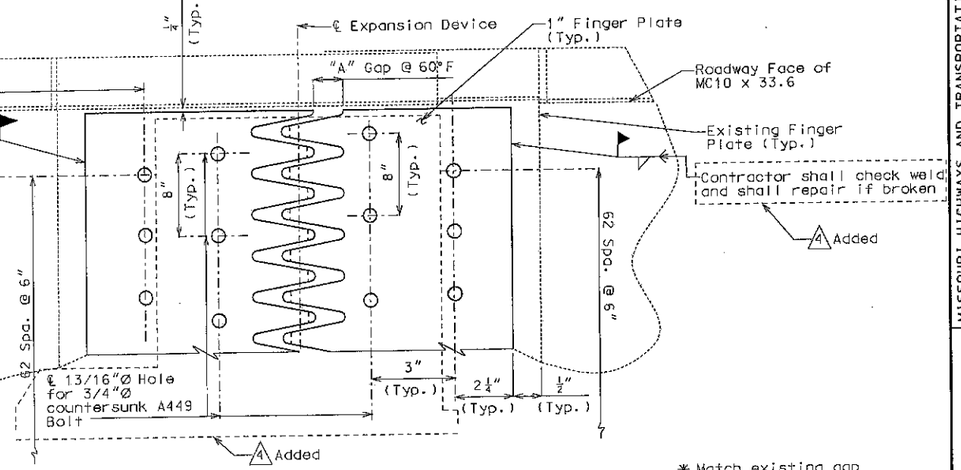
At the contractor's option, welding of the bolts to the finger plate may be field or shop welded. Any coating damaged by field welding shall be repaired in accordance with Sec 1081.



PART SECTION SHOWING MODIFIED FINGER PLATE TO BE INSTALLED



DETAIL A



PART PLAN OF MODIFIED FINGER PLATE EXPANSION DEVICE

Note: Asphaltic concrete not shown for clarity.

* Match existing gap

TABLE OF PLATE DIMENSIONS				
Pier No.	"A"*	"B"	"C"	"D"
3	4¾"	10½"	8¼"	5/8"
5	5¾"	12½"	7"	5/8"
7	4¾"	10½"	7¼"	5/8"
